ABOUT US. The Smart Sustainable Community Int. Group (the Smart Group) comprises prime experts, specialists and investment advisors from different parts of the world, Australia, Malaysia, Russia, EU, India, and USA. The Smart Group includes as its key members the one of the pioneers of intelligent cities and innovation ecosystems (N. Komninos, URENIO, INTELSPACE), the groundbreaker of intelligent/smart eco cities™ (EIS Ltd), the first smart/intelligent investment advisory team, led by M. Minevich (Going Global), and selected minds in ontological/intelligent engineering and urban planning and informatics.

EIS Encyclopedic Intelligent Systems Ltd (EU, Cyprus), together with its Russian counterpart, Энциклопедические Интеллектуальные Системы (ЭИС ООО, Moscow, Russia), are coordinating members of the Smart Group, being among the leading innovative companies enabling full sustainable communities and innovation environments of all sizes and scales: local, urban, regional, national, international and transnational.

The Smart Group is singular on the emerging smart cities global market by offering integrated, holistic models of innovation national ecosystems, digital cities, cyber cities, intelligent cities, and green cities as smart sustainable communities, where new solutions, social spaces, collective intelligence, and innovative technologies are developed, tested and embedded.

Creating the Smart Sustainable Community Concept, the Group advances the Smart/Sustainable World Strategy integrating such global industrial initiatives as the IBM’s Smarter Planet (computer technology, software, services, business intelligence and data analytics), Cisco’s Smart + Sustainable Communities (networking and communications technologies), Huawei’s smart cities (telecom networks), Siemens’s smart cities (industry, energy, healthcare), Microsoft’s smart cities, etc.

The Smart Group is unique in providing two types of complete services: i. Full Sustainability Smart Community (City, Region, or Country) consultancy services; ii. Full Sustainability Intelligent Community (City, Region, or Country) turnkey solutions. The latter implies delivering a smart eco community of different sizes, from regions to cities and towns, and master-planned developments, as ready for occupation and sustainable living. The smart city turn-key process includes all of the steps: the site selection, negotiations, spatial/space planning, construction coordination, complete delivery and centralized management, and smart urban growth.

Thus the Group implements the most viable construction strategy of intelligent sustainable cities as physical-virtual-social-natural territorial systems of innovation, intelligence, digital space and ecosystems, the most advanced urban agglomerations in the human history.

PUBLIC PROJECTS UNDER APPROVAL:
- EU, Cyprus: SMART/SUSTAINABLE CYPRUS as a development model for a SMART EUROPE
- EU, Cyprus: PAFOS – SMART ECO REGION

RUSSIA, Skolkovo: SMART SUSTAINABLE COMMUNITY MODEL™. The Group is planning to implement the fully sustainable and viable construction strategy of intelligent cities with smart urban infrastructures, innovation clusters, social intelligence, digital spaces and natural ecosystems.

PUBLIC PROJECT UNDER STUDY
- MOSCOW FEDERATE DISTRICT AS A SMART ECO CITY DEVELOPMENT
- SMART/SUSTAINABLE RUSSIA (i-Russia)

PRIVATE PROJECT AS COMPLETED
EU, Cyprus: Conception and Modeling of the world’s first fully sustainable intelligent community: “Neapolis Smart Eco City” (Development Costs: EUR 2.5 b). Its further construction as the smart eco city development is now under full responsibility of its current owners and promoters.

The Corporate Mission and Strategy of the Smart Group is to contribute in building a sustainable Urban World by converging physical/ecological, technological/digital, and human/social spaces.
[Information about the Smart Group can be found at the internet site: http://www.eis.com.cy; contact emails: abdoul@cytanet.com.cy; ontopedia@gmail.com]
SUMMARY
The 21st century necessitates the wholly new development principles, policies, processes, and objectives: eco-intelligent world strategies, models, and solutions. It’s when the world is synergistically driven by natural capital, social capital, technological and digital capital, like as the Global Internet/Web of Things, Knowledge and Social Intelligence and Renewable Energy Sources, and emerging as a Smart World by converging the Cyber, Social, and Physical Worlds.

Such a “best of all possible Worlds” is to merge an Eco World, Digital World and Social World, unifying the ecological principles of the eco world development, the technological principles of the information world development, and the social principles of the human world development. Accordingly, a truly sustainable community (city, region, or country) is a geographical entity which is digitally smart, socially intelligent, and ecologically sustainable. Geographically, a Smart Community can be a real estate/property development, an urban economic development zone, a city, a district, a region, a mega-region, a country, an international community, or a global community.

At the global level, the Smart World is a Smart Eco Planet of intelligent sustainable communities: countries, regions, cities, towns, villages, districts, and neighborhoods. The Smart Eco Planet is mostly about intelligent communities, natural ecosystems, digital economy, intelligent people, smart governance, smart transport and intelligent ICT networks, smart environments, eco-smart living and creative working in intelligent eco-buildings, cities, regions, countries, forming a global innovation ecosystem.

As a special type of sustainable community, a smart city is accordingly a unified urban entity with three critical layers/levels/spaces, all planned, developed and managed as its integral parts:

- **Digital/ICT/Hi-Tech/Ubiquitous/Cyber/Digitally Smart and Intelligent City** (Digital/Information Capital; Digital Urban Spaces, Multi-Play Telecom Network, ICT spaces/systems/applications, Sensor Networks, Ubiquitous Computation, Cloud Computing, Network-integrated Real Estate, City OS, Intelligent City Management Platform, Augmented Virtual Reality, Virtual Lifestyle);
- **Sustainable/Ecological/Green/Zero-Carbon/Zero-Waste/Eco Friendly/Clean City** (Natural Capital; Natural Urban Spaces and Ecosystems, Green Energy Network, Real Eco Estate, Ecological buildings, Green Lifestyle);

A truly smart city is three innovative cities in one, the **Urban Trinity of Information Cyber City, Intelligent/Knowledge City and Ecological/Clean city**. It is essential to draw distinctions between a smart city, as a unified urban entity, and “smart city” technologies, applications, and systems, as well as fragmented “smart city” projects, lacking the overall conception of the smart city project and resulting in unsustainably over-costly ventures.

The Smart Eco Cities, as globally networked innovative ecological urban areas, are key preconditions for the Smart World of Intelligent Communities,

INTRODUCTION: Towards a Smart World

The current world faces an increasing number of planetary challenges involving Environment, Energy, Food, Water, Transportation, Infrastructure, Society, Healthcare, Education, Governance, and Economy. The 21st century’s start has been marked by international terrorism, world crisis, regional wars, and civil unrests. On the upside, the early period intensified the digital revolution, technological revolution, environmental revolution as well as social revolutions shaping more integrated, inclusive, intelligent, or sustainable world. Humans advance science, technology and industry to create more wealth, thus to overcome social injustices and social ills prevalent today - hunger, poverty, unemployment, illiteracy, diseases, wars, environment degradation, and many other social evils. These global problems still continue because of the dominant economic and political self-interests, missing to form the self-organized, spontaneous global order, a sustainable world, sustaining the self-organizing processes of human life supporting systems: ecological, social, economic, technological, and cultural. Sustainable global order is a spontaneous emergence of various kinds of human orders from a combination of self-interested individuals, organizations, and social groups, and national interests of countries and regions, who are trying to sustain self-organizing processes through different types of planning, local, business, urban, economic, strategic, spatial, environmental, or national. Being found in physical, biological, social networks, economics, and ecosystems, the self-organizing processes cover a free market economy, human culture, the Internet, the natural evolution on Earth, as well as the smart/sustainable world.

As an integrated whole, the Sustainable World is to merge an Eco World, Digital World and Social World, unifying the ecological principles of the eco world development, the technological principles of the information world development, and the social principles of the human world development. It’s thus emerging as a Smart Eco Planet of eco-intelligent social communities: countries, regions, cities, towns, villages, districts, and neighborhoods. Combining spontaneous order principles and smart communities planning, the Smart World is self-organizing as global knowledge ecosystems, involving natural ecosystems, social cohesion, smart economy, intelligent people, efficient global governance, smart transport and ICT networks, sustainable living and creative working.

Accordingly, building the new world calls for globally converging models, initiatives, principles, strategies, standards, solutions, and technologies. It requires merging all its chief domains, physical, natural, digital and knowledge worlds, assets, and resources to develop a smarter world with intelligent eco-communities and integrated
world infrastructures, such as the Future Internet/Web of Things or distributed RES Networks, as globally replacing the unsustainable fossil fuel infrastructures.

Our research and innovative practice, added up with the good and best cases studies, are proving that a true sustainable community is a physically efficient, digitally smart, socially intelligent, and ecologically sustainable community, driven by physical capital, natural capital, social capital and digital capital. Following the overall concept of Smart World, a real smart city is a Smart Sustainable City, Intelligent Eco City, or Smart Eco City, converging physical assets and technological assets, natural resources and knowledge assets, human resources and intellectual capital (see the WORLD Trinity Diagram).

THE RISE OF THE SMART CITY: Market Prospectives

The significant part of the world’s wealth is in the form of land and buildings, commercial property and residential property and infrastructure capital. The real estate, and now the world’s population, is mostly concentrated in an urban area, as a town, large town, city, large city, metropolis, conurbation, megalopolis (unified super-city), or ecumenopolis (the entire urban population). Just a decade ago, the 7 largest megalopolises (Indo-Gangetic Plain, Pearl River Delta, Blue Banana, Yangtze River Delta, Taiheiyo Belt, Great Lakes Megalopolis, and Northeast Megalopolis as Boston - Washington) dwelling about 10% of human population, taking a lead in overpopulation, energy consuming, air, water, light, and soil pollution, urban sprawling, ecosystems degradation, and unsustainable urbanization.

The key feature of any city is its capacity to aggregate people, skills, talents, resources, capital, businesses, government, and infrastructure, physical and social, with complex systems for land use, transportation, utilities, sanitation, housing, and public services.

Unlike the traditional legacy city, a smart city, new or retrofitted, is anticipated as a prime city of well being, prosperity and productivity. It is characterized as an innovative urban settlement with Intelligent Information and Communications Technology Infrastructure inbuilt in the Environment, Transport, Utilities and Energy Networks, Buildings, Social Infrastructure, Government, and Services.

As smart city projects spread across the world, Nikkei Business Publications has conducted a research on the sunrise market and projected the market size of 3,1 trillion Euro for the next twenty years. Meantime, according to the Cisco’s estimations, the sunrise market of smart/ intelligent cities projected over $ 1 trillion in the next decade. Japan announced smart cities as the next export area (Japan News Net) competing with the USA and Korea.

The global role of cities is just overwhelming. The cities are key contributors to the national GDP, like Chinese cities will contribute 90% of China’s GDP by 2013, being the principal source of economic growth, financial and political power. On the downside, the world’s urbanization is bringing natural and urban ecosystems damages, environmental and social cohesion degradation, air, soil, water, and energy pollution, generating 80% of global harmful emissions and accounting for 75% of the world’s energy consumption.

As a result, there are now well-promoted global smarter world/cities initiatives, as the IBM’s Smarter Planet, Cisco’s Intelligent Urbanization, or Smart + Connected Communities. This is added up with the public initiatives like EU 2020 Strategy for smart, sustainable and inclusive growth, UN Compact Cities Program, EU Initiatives on Smart Cities and Communities. The number of smart cities projects is hardly to count as the number of the corporate reports on smart cities. Just one global IT corporation, IBM, is boasting of being involved in about 2000 smart city projects. According to the Intelligent Community Forum, more than 500 cities globally have been introduced with smart / intelligent characteristics.

There are smart cities projects in Asia, the Middle East, Europe, Americas, South and North, Europe, Russia, and Africa. The statistics show that over 2000 Smart City projects have been started or going on in Asia, Europe, the Americas and Africa: there have been 1500 by 2010, with an annual compounded growth rate of 20%. Among the stakeholders, there are Governments, Municipalities, Property Developers, Utilities, IT Companies, Engineering Companies, Architectural Firms, Telecommunications Companies, Infrastructure Providers, Grid Providers, Building Systems Suppliers, and Automakers.

Already, several new cities have been master-planned from scratch, on greenfield sites, as Putrajaya (Malaysia), Songdo and Incheon (Korea), King Abdullah Economic City (Saudi Arabia), GIFT, Lavasa, and Nano City (India), Wuxi Huishan and Dongtan and Meixi (China), Dubai Waterfront, Dubai Central, Masdar (UAE), Living PlanIT Valley (Portugal), Neapolis (Cyprus), and Skolkovo (Russia).

Since most part of the world’s assets, real estate assets, financial assets, natural resources and human assets, is aggregated in cities, any innovative change of urban development will cardinally affect a whole global development.

The Smart Issues To Be Addressed

- What is a real smart city? What defines the true smart city, or what makes a city full sustainable?
- How to distinguish the common city, the smart city, the digital city, the intelligent city, the eco city, the knowledge city, and the innovation city?
What are the main market drivers, opportunities and challenges for the smart city development?
What are the key policies, strategies, standards, technologies, and issues of the smart city development?
How do smart city models and projects differ across the world?
Which financing models are used in the smart city development?
Who are the key players in the smart city market and how do they relate to each other?
How large is the global smart city technology market, and how will it be parted by type, strategy, technology, budget, industry sector, region, and ownership?
What is smart branding and smart city branding?
What is an intelligent nation? And how is it made?

WHAT IS NOT A SMART CITY

Nowadays, many municipalities are embracing the Smart City strategy, installing municipal wireline or wireless broadband networks; implementing e-government by providing a digital access to city departments’ web sites; integrating public transit with intelligent facility systems; developing distributed RES networks cutting carbon footprints, applying eco principles to reduce, recover, recycle, and reuse the urban resources. Energy-efficient solutions, computer networks, intelligent building networks, digital networking equipments, data analytics software, optical telecommunications systems, smart mobile networks, smart/intelligent applications, technologies, devices, objects, and systems, intelligent sensor/actuator networks, intelligent traffic systems, smart community technologies, resources tracking systems, cloud computing, augmented reality, rich multimedia, embedded control systems, ubiquitous computing environment, web 3.0, internet of things, all just components, constituents, elements, factors or ingredients of a smart urban entity. It’s merely enabling means of innovative cities, integrating new technologies to obtain a strategic goal of full sustainability, citizen well-being, and social development.

When a city of the future is defined as “a community that is run on networked information providing integrated services” (Cisco), it’s only part of truth, a small part of the whole truth. We need to tackle a sustainable future community in all the possible complexity and wholeness, timely identifying all sorts of confusion, misrepresentation, misunderstanding, commercial propaganda, empty promises, partialities, or even a new type of "brainwashing"; "greenwashing" or "smartwashing". Being a place where the virtual and the real meet, merging into augmented urban reality, a Smart City is emerging a structured organic whole, single urban entity, completeness, totality, and integral unity of is parts, components, constituents as technologically, socially, and economically integrated/connected urban eco systems. Now what is not a smart city, all what is only a part of a true smart city; namely:

It is not a conventional city/metropolis/urban center
It is not a digital city or wireless city
It is not an ecological city or green city or ecologically healthy city or quality urban system
It is not an intelligent city or knowledge city or social intelligence city or creative city
It is not a network-based smart + connected community
It is not a city with a smart community
It is not a city with a smart environment
It is not a city with a smart economy
It is not a city with a smart transportation
It is not a city with smart utilities and energy systems
It is not a city with smart education
It is not a city a smart public safety
It is not a city with smart buildings
It is not a city smart healthcare
It is not a city with smart public administration
It is not a city with business parks
It is not a city with innovation clusters
It is not public administration/authorities that deliver innovation services and infrastructure, based on information and communication technologies
It is not a city with a smart economy; smart mobility; a smart environment; smart people; smart living; and, finally, smart governance
It is not a city just with smart Transportation, Utilities, Healthcare, Education, Public Safety, or Building Systems Management.
So, if the government is striving to advance ecological infrastructure, smart utilities, smart transport, smart buildings, smart economy, smart government, smart environment, smart lifestyle, or smart communities, in the fragmented costly ways, without an integrated, holistic regional/urban planning, it’s hardly about a true smart city.
WHAT IS A SMART CITY: A Smart Sustainable City™

There are hundreds and hundreds of eco cities, innovation communities, smart cities, knowledge cities, and intelligent cities, but there is no smart city of full sustainability, social, economic, ecological and technological. The real smart city is a Smart Sustainable City, bringing together all the innovative characteristics associated with organizational change, technological, economic and social development of a modern city. “A city may be called ‘smart’ when investments in human and social capital and traditional (transport) and modern (ICT) communication infrastructure fuel sustainable economic growth and a high quality of life, with a wise management of natural resources, through participatory government”.

In fact, a smart city involves three key forms of capital: technological and information capital, human and social capital, as well as physical and ecological capital. For “infusing intelligence into each subsystem of a city, one by one – transport, energy, education, health care, buildings, physical infrastructure, food, water, public safety, etc.—is not enough to become a smarter city. A smarter city should be viewed as an organic whole.” (HBS). Crucial, within the physical-human-digital innovation environment, the human and social intelligence, the intelligent city should predominate over the digital infrastructure for communication, knowledge networks and management, as one of the pioneers of i-cities and the key member of the Smart Group confirms (Komninos). So, real smart cities integrate digital cities, intelligent or knowledge cities, and green cities, following the eco city development principles, as stated by the Shenzen Declaration on Ecocity Development.

Such a harmonious smart/sustainable city is a model of sustainable future, designed as the best place to live, to work, to learn and to visit. Its sustainable development model incorporates the most valuable concepts and practices of rising worldwide digital/smart cities, ecological communities, intelligent cities and knowledge clusters and territorial systems of innovation, as technopoles, clusters, technology parks and districts, and knowledge networks.

A true Smart City makes a single complex urban entity with three pillars: technological foundation, social foundation and ecological foundation. It’s three innovative cities in one, the Urban Trinity of Information Cyber City, Intelligent/Knowledge City and Ecological/Clean city, like as:

III. Knowledge/Learning/Innovation/Intelligent/Science/Intellectual/LivingLab/Creative/Human/Social City/Noopolis (Intellectual Capital; Social Cohesion, Knowledge Assets, Knowledge Triangles, Health Triangles, Intelligent/Smart Lifestyle)

A City of the Future is envisioned as a key node of the Smart/Sustainable World with smart communities, buildings, infrastructure, government, intelligence, education, healthcare, public safety, telecom, banking, retail, stimulus, work, traffic, transport, computing, products, food, energy, oil, and water. For the Smart World is all about knowledge society, smart economy, smart people, smart governance, smart transport and ICT, smart environments, smart living and creative working in eco-intelligent buildings, cities, regions, and countries.

Thus, the Smart City is to combine the best features of innovative communities, intelligent cities, digital towns, smart urban areas, green municipalities, or zero energy/ carbon/waste cities.

Emerging as an intelligent sustainable community, it is to be distinguished as:

- a world-class community of eco-intelligence implementing the most innovative development strategy;
- an urban ecosystem of sustainable living, well being, and quality of life;
- a master-planned knowledge ecosystem and innovative business environment, fostering a climate and culture of innovation, creativity, quality lifestyle and modern entrepreneurship, health and well-being;
- an integration of living/residential, working, commercial, retail, recreating, learning, and public spaces, buildings and facilities;
- a common model/paradigm for globally emerging sustainable communities and smart cities.

The true Smart City is committed to the following Value Propositions:

- Eco-Intelligent Infrastructure
- Sustainable Living, Well Being and Quality of Life
- Ecopolis (smart environment/natural capital and resources, eco-health, safety and security, engineering and sanitation, conservation and protection, landscape integrity, and awareness; re-use, reduce, recycle and recover of resources, materials and energy);
- Smart People, Communities, and Society, Social and Human Capital;
- Future Proof Smart Technologies;
- Network Integrated Township (Smart Connected Communities, Ubiquitous Eco City);
- City Intelligence (Knowledge and Health Triangles, Intelligent Management Urban Platform);
- Environmental Infrastructure, Smart Utilities and Energy Networks;
- Smart Mobility (innovative transportation, FO ICT networks);
Intelligent Green Lifestyle and QoL Facilities (cultural, health, safety, housing quality, education, touristic, and entertainment);

- Smart Governance (i-services, social, cultural and political cohesion);
- Innovation Economy and Knowledge Industry
- Sustainability Standards;
- Private, Public and Civil Society Partnership; financing schemes: BOT, BOOT, BOO, BLT, DBFO, or DCMF (Design, Build/Construct, Own, Operate, Transfer, Manage, Finance, Lease);
- Intelligent Investment Projects (Impact/Socially Responsible Investment)

Thus the key characteristics of truly smart city is intelligent/knowledge communities of smart people and territorial institutions enabled with the eco-smart urban infrastructure, integrated and controlled by a Single Intelligent City Management Platform, the foundation of the Urban Internet of Systems, Services, Knowledge and Citizens. The Eco-Smart Urban Network is to comprise:

- Environmental Infrastructure: eco-smart water supply systems, waste disposal facilities/treatment systems, pollution control systems and services
- Intelligent Traffic Infrastructure, Networks, Facilities, Systems and Services
- 40-100 GB Intelligent Optical ICT Infrastructure, Networks, Systems and Services
- Social Infrastructure (Knowledge Triangle Networks, Health Triangle Networks)
- Onsite Distributed Energy Networks of Renewable Resources built in the Smart City Eco Estates, Residential and Non-residential.

SMART ECOCITY CHARACTERISTICS

- World class conception, sustainable city strategy, model, design, architecture, planning, construction, technology, service, and life
- Eco City Development: Security, Sanitation, Eco-Engineering, Conservation and Protection, Landscape Integrity, Eco-Awareness
- 100% renewable energy/Carbon neutral/Green Energy positive city
- Next Generation FO ICT Network/Services, Renewable Energy Sources, Social Intellectual Capital
- Smart/Intelligent City Environments, Knowledge Enabling Grid, Knowledge/Innovation City
- Health Park of global excellence (World Class Medical Center, Eco Hospital, Rehabilitation Center, Wellness Center, and Assisted Living)
- Education Park & R&D & Innovation & Technology Park & Commerce and Business Parks of global excellence.
- Smart Connected Real Estate with environmental infrastructure and eco-smart buildings
- Green Residential with intelligent home environments
- Integrated wellbeing, experience and lifestyle; top quality of life/work/study supported by smart green urban environments. Living quality lives, meaningful, enjoyed, creative, in virtual, green and intelligent spaces
- Global benchmark of future urban sustainability

SMART CITY SYNTHESIS: EU 2020 Strategy, IBM's Smarter Planet and Cisco’s Smart + Communities

The Smart Sustainable City concept is in line with the Europe 2020 highlighting as priorities:
- Smart growth: developing an economy based on knowledge and innovation.
- Sustainable growth: promoting a more resource efficient, greener and more competitive economy.
- Inclusive growth: fostering a high-employment economy delivering social and territorial cohesion.

In the market world, there are two big IT companies promoting two big ideas, for the same global audience: the IBM's Smarter Planet and the Cisco's Smart + Connected Communities.

Seeing how fast things are going, every big corporation is jumping on the bandwagon. Recently, the big couple have been adjoined by other international corporations as Siemens (Infrastructure & Cities), Microsoft (Digital Cities/Azure Platform/Connected Government Framework), Huawei, Alcatel-Lucent, Intel, Oracle (iGovernment), France Telecom (Orange), etc. (see the corporate reports).

The Cisco’s key promoter of intelligent urbanization, Wim Elfrink, is talking about five applications, transportation, energy and utilities, real estate, safety and security, and citizen services (education, government, healthcare, sport and entertainment), to achieve the network-based sustainable communities.
The IBM’s CEO, Sam Palmisano, is talking about 3i World, instrumented, interconnected and intelligent, covering whatever you like to be more efficient, sustainable, and intelligent, from Analytics to Work, from Oil/Gas to now Smarter City.

It’s plain that more efficient way is to go with the over-arching initiative of the Smart World, comprising the Smarter World of Smart + Connected Communities, by applying the integrated, holistic model at every level, global, national, regional, urban or local, as with the proof-of-concept pilot project, “Neapolis Smart EcoCity”, http://www.neapolis.com.

By its very definition introduced above, a true sustainable city is a multiple urban entity, having many features, forms, or spaces. As a minimum, it’s a triplex city of information, ecology and humans.

From technological prospects, its a digital city, cyber city, networked city, or digitally smart city, where NG ICT networks, mobile and ubiquitous and cloud computing, 4G+ wireless networks, augmented virtual reality, sensor networks, software agent technologies, etc. are embedded in the physical urban environment.

From ecological perspectives, it’s a clean city, green city, eco city, or ecologically healthy city, where distributed energy networks, renewable energy sources, green technologies, etc. are embedded in the physical urban space.

From social prospects, it is an intelligent city, social capital city, knowledge city, innovation city, or creative city, where knowledge-intensive activities, intelligent governance and social networks, meaningful public spaces, and knowledge triangle infrastructure are shaping the social city environment.

Full sustainability consists in a synergetic integration and interaction of all urban dimensions, as integrated physical, virtual, natural, social, and institutional spaces. As a result, a unified digital infrastructure, as built into environmental infrastructure or RES networks or eco-buildings, supports all city ecosystems, innovation economy, infrastructure and utilities, governance, and connected communities.

As smart/green/intelligent technologies are shifting to sustainable technologies, so smart/green/intelligent communities, to sustainable communities - districts, towns, cities, metropolises, regions, countries or the entire planet.

Crucial, relying only on any big technology developers hardly decides the principal challenges of sustainable urban development, be it the Huawei’s smart city technical concept or Oracle’s solutions for smart cities, Smart Processes, Smart Infrastructure, and Smart Innovation for local governments, smartly promoting their business products, services, packages and suites.

However big, they all are merely technology companies with the astute marketing strategy to capitalize and promote accumulated digital capital and knowledge assets, bridging it with the physical capital (infrastructures).

It's not strange that no industrial corporations, however big, have been originating smart cities projects, but what is mostly planned by governments, national or local, or some innovative real estate developers.

SMART BRANDING

The smart companies’ value is largely based on the intellectual capital. The world’s most valuable brand names are already connected with smart business and green industry or social capital investment, like the global world cities are already capitalizing on the best world’s skills, talents, and intellectual capital.

The recent statistics show that the Smart Technology and Telecom providers have the brand equity/value exceeding $ 100 billion, like Apple with the i-tablet computing products and services, the brand value about $ 153 billion, or IBM with the Smarter Planet methodology, with the brand value about $ 101 billion, see BrandZ Top 100 Most Valuable Global Brands 2011. Nowadays, the brand name and equity is becoming of most decisive factor of all assets, as economic resources producing economic benefits and values, tangible and intangible, physical assets as fixed real estate, plants and equipments, and current assets as cash and inventory, and nonphysical assets as patents, goodwill, trademarks, software, bonds and stocks.

As far as the BRAND Equity is measured as the MARKET CAPITALIZATION minus TANGIBLE ASSETS and INTANGIBLE ASSETS (measurable), for real smart legal entities, the brand equity approximates the market capitalization.

In the new Smart Branding Market of smart city products and services, processes and technologies, the following companies are proposed as leading in terms of capabilities and visibility: IBM, Buro Happold, Siemens, GE, Accenture, SAIC, Alstom, Mitsubishi Heavy Industries, ABB, Oracle, Samsung, Cisco, Philips, SAP, HP, Home Depot and Autodesk. They are selected among technology integration companies, utilities, ICT firms, telecommunications carriers, sustainable urban planners, designers, architects, engineers, consultants and academic institutions: see “Who’s the Leading Smart-City Brand” report. The brand name recognition is today a road to getting a leading position in the emerging global knowledge economy. The intelligent brand name is a key to success. Belonging to a family of intangible assets and intellectual property, it amazingly provides enormous real value, measured at many levels: globe, country, industry, firm, product or customer.

The smart branding strongly drives business value and global sales, top-line revenue and bottom-line profits, productivity, costs, revenues, quality services, market values, share prices, without having a physical value of equipment, without appearing on balance sheets, and without being the physical assets which one can see or touch or physically measure. Welcome to the intangible/invisible world of knowledge assets, the smart world of cyber and
real spaces, the physical world of material entities, the social space of human beings, and the virtual world of software entities.

**SMART PROPERTY RE/EVOLUTION: From Real Estate Developers to Smart/Intelligent City Developers and Sustainable Communities Builders**

That’s most critical, neither technology company, however big or dynamic, alone or in cooperation, is capable to meet the principal challenges of sustainable urban development. IBM with its Smarter Planet business strategy, or Cisco Systems with its the network-based Intelligent Urbanization, or Huawei Technologies, targeting for a Smart City with NG ICT Network and Service Planning, Single Infrastructure, Multi-Industry Integration, attractive ICT applications, knowledge workforce, and fair society. They are merely technology developers, with some singular innovative marketing strategy, but all trying to capitalize and promote accumulated digital capital and knowledge assets, bridging it with the physical world capital (infrastructures). One is tapping the expertise in business analytics, systems management, sensors and security (IBM). Another, in the network routing and switching and (optical) networking equipment and "smart" ICT services (Cisco Systems). The third (Siemens), in industrial and building automation, lighting, power generation technology, water treatment systems, medical technology, communication systems, and computer PLM software, etc.

It's not so surprising that neither technological corporation, nor engineering and industrial group has managed to originate and implement the overall model of smart cities from the scratch, like the Smart Group is preaching and promoting.

No technology providers, alone or together, has enough knowledge and expertise and capacity to systematically go for a full sustainable city development, a complex public-private-civil society partnership project, involving as many stakeholders as sustainable urban planners & designers, green architects, smart infrastructure planners and engineers, environmental engineers, technology developers, real estate developers, urban economists, and what not. Crucial, the life cycle of any true sustainable city starts from the principal stage, conception and modeling, laying the foundation for the whole enterprise, sustainable urban planning and design, technological development, construction and implementation, extended with smart, sustainable, and inclusive growth and expansion. Again, sustainable urban planning encompasses the design of urban environment, environmental infrastructure, green energy systems and smart utilities and ecological buildings, multi-play fiber telecommunications networks, distributed systems of networked computers, servers farms, data centers, or cloud computing, smart public amenities and facilities, knowledge triangle institutions, health triangle facilities, intelligent city services, etc.

Thus, in developing Smart Sustainable City, a big technology developer, or architectural firm, or real estate developer, or ICT integrator, or urban planner, are replaceable contributors. Only the integrating “smart city modeler”, "intelligent city developer", “sustainable real estate developer”, is in full capacity to develop a Smart/Sustainable Community Development Framework, to be deployed as an Intelligent Sustainable Community, local, urban, regional, national, or international (see the Intelligent Sustainable City/Community Green Book: [http://www.eis.com.cy](http://www.eis.com.cy)).
INTELLIGENT NATIONS PROJECTS: The Smart/Sustainable Cyprus

In the emerging smarter world, nations compete with each other like enterprises and cities, for investment, resources, skill and talents, higher international prestige, better global image, and cultural, economic, and political leadership. Nowadays, there are several countries, mostly islands, striving for the status of intelligent nations as a national strategy and government policy; namely:

1. Singapore, Intelligent Nation 2015 (iN2015), 10 years master plan of an Intelligent Nation, a Global City, powered by Infocomm, to enable: Innovation, Integration, Internationalisation. Singapore is aimed to transform the country into “an Intelligent Nation, a Global City, powered by Infocomm”. To achieve the goals of the masterplan, the Infocomm Development Authority of Singapore (IDA), together with the industry, identified programmes and initiatives categorized under four building blocks: globally competitive infocomm industry; sectorial transformation of the key economic sectors, government and society; ultra-high speed, pervasive, intelligent and trusted infocomm infrastructure; globally competitive infocomm manpower:

2. The Smart Island Malta, the National ICT Strategy (the Smart Island strategy of seven streams, the national RTDI strategy; the National Industrial Policy; SmartCity Malta Project of the global knowledge-based township: the next generation ICT environment, a connected society, putting the ‘e’ on everything, a smart and global workforce, reinventing government, e-Business, world leading ICT industry): https://mitc.gov.mt/page.aspx?pageid=263

3. Intelligent Taiwan, formulated by the Council for Economic Planning and Development, and involving all ministries, the i-Taiwan is advancing 12 construction projects in transportation (fast network, port-city regeneration, international airport city), industrial innovation (hi-tech industrial clusters, intelligent Taiwan, industrial innovation corridors), urban and rural development (urban and industrial park-regeneration, farm village regeneration), environmental protection (coastal regeneration, green forestation, flood prevention and water management, and sewer construction) as well as intelligent industries (cloud computing). Its five key concepts are: regional development balance, industrial innovation, new urban and regional features, intelligent capital accumulation, and sustainable development. Its key purposes are expanding domestic demand, improving the investment environment, boosting the health of the economy, and upgrading the quality of life. The total investment is about NT$ 4 trillion: http://www.cepd.gov.tw/encontent/

Implementing the EU Strategy for smart, sustainable and inclusive growth, the Smart Group is advancing Smart/Sustainable Cyprus Program with the most innovative conception and strategy, as an Intelligent Nation Project, with a comprehensive and holistic approach to developing a smart and creative nation driven by intelligence, integration and innovation. Such a unique social change of whole country is challenging and historical. Cyprus, as a strategic island in the eastern Mediterranean, is fully able to transform into knowledge-centered nation (land, country, or state) with all the intelligent capabilities and innovation resources. Changing the nation into an intelligent land needs to take into consideration three i-determinants:

Intelligence (social, human and intellectual capital, intelligent citizens, smart people, smart/knowledgeable communities, the wisdom of population, collective intelligence, smart governance, and digital intelligence);
Integration (globalization, globally collaborative innovation networks, the Future Internet, W 3.0, integrated supra-networks of the research, development, technology, innovation, business, and public sectors of life, internet-based ubiquitous connectivity, integrated fixed and wireless ultra-fast fiber networks, fixed and mobile GIS and GPS applications, intelligent internet of things /web and entities, the wisdom web of knowledge, unified learning, research and innovation space);
Innovation (innovative social policy, knowledge economy, green economy, digital economy, national ICT strategy, smart environment, green technologies, ICT networks, computer network technology, the internet of things, multimedia applications, broadband infrastructure, omnipresent computation, digital knowledge resources and services, everywhere and anytime, coordinated research, science and technology, and business parks, intelligent services, intelligent power grid and network infrastructure, smart electricity/gas/water meters, smart buildings and homes, streets, villages, towns, cities, areas, and countries).

INFORMATION RESOURCES

SMART WORLD MODELS

The 11th IEEE International Conference on Computer and Information Technology (CIT-2011)

The Smart World is modeled as a Smart Eco Planet of intelligent sustainable communities: countries, regions, cities, towns, villages, districts, and neighborhoods. The Eco-Smart World is about intelligent communities, smart natural ecosystems, digital smart economy, intelligent people, digital smart governance, smart transport and intellectual ICTs, eco-environments, eco-smart living and creative working in intelligent eco-buildings, cities, regions, countries, and global innovation ecosystems.
A real Smart Sustainable City is accordingly a unified urban entity with three critical parts/layers/levels/spaces, all planned, developed and managed as its integral elements:

- **Sustainable/Ecological/Green/Zero-Carbon/Zero-Waste/Eco Friendly/Solar City**: (Natural Capital; Natural Urban Spaces and Ecosystems, Green Energy Network, Real Eco Estate, Ecological buildings, Green Lifestyle);

A truly smart city is nothing but three innovative cities in one, the Urban Trinity of Information Cyber City, Intelligent/Knowledge City and Ecological/Clean city. It is essential to draw distinctions between a smart city, as a unified urban entity, and “smart city” technologies, applications, and systems, as well as fragmented “smart city” projects, lacking the overall conception of the smart city project and resulting in the unsustainably over-costly ventures. The Smart Eco Cities, as globally networked intelligent, innovative ecological urban areas, are key preconditions for the Smart World of Intelligent Communities.

2. IBM’s Smarter Planet. **What is a Smarter Planet**. By smarter we mean the world is becoming instrumented, interconnected and intelligent. The signs of a smarter planet are all around us. Data is being captured today as never before. It reveals everything from large and systemic patterns—of global markets, workflows, national infrastructures and natural systems—to the location, temperature, security and condition of every item in a global supply chain. At IBM, we want that intelligence to be infused into the systems and processes that make the world work—into things no one would recognize as computers: cars, appliances, roadways, power grids, clothes, even natural systems such as agriculture and waterways. **Since 2008**, we’ve talked about what it takes to build a smarter planet. We’ve learned that our companies, our cities and our world are complex systems—indeed, systems of systems. Advancing these systems to be more instrumented, intelligent and interconnected requires a profound shift in management and governance toward far more collaborative approaches. [http://www.ibm.com/smarterplanet/us/en/](http://www.ibm.com/smarterplanet/us/en/)

3. Palmisano, S. (2008), **A Smarter Planet: the Next Leadership Agenda**. Consider how much energy we waste, how gridlocked our cities are, how inefficient our supply chains are, how antiquated our health system is, how our planet’s water supply is drying out, and, of course, the crisis in our markets. [http://www.ibm.com/ibm/ideasfromibm/us/smartplanet/20081106/sjp_speech.shtml](http://www.ibm.com/ibm/ideasfromibm/us/smartplanet/20081106/sjp_speech.shtml)

4. **Europe 2020**. The EU’s growth strategy for the coming decade. In a changing world, we want the EU to become a smart, sustainable and inclusive economy. **Smart growth** means improving the EU’s performance in: education (encouraging people to learn, study and update their skills); research/innovation (creating new products/services that generate growth and jobs and help address social challenges); digital society (using information and communication technologies). **Sustainable growth** means: building a more competitive low-carbon economy that makes efficient, sustainable use of resources; protecting the environment, reducing emissions and preventing biodiversity loss; capitalising on Europe's leadership in developing new green technologies and production methods introducing efficient smart electricity grids; harnessing EU-scale networks to give our businesses (especially small manufacturing firms) an additional competitive advantage; improving the business environment, in particular for SMEs; helping consumers make well-informed choices. **Inclusive growth**: a high-employment economy delivering economic, social and territorial cohesion. Inclusive growth means: raising Europe’s employment rate – more and better jobs, especially for women, young people and older workers; helping people of all ages anticipate and manage change through investment in skills & training modernising labour markets and welfare systems; ensuring the benefits of growth reach all parts of the EU. These three mutually reinforcing priorities should help the EU and the Member States deliver high levels of employment, productivity and social cohesion. Concretely, the Union has set five ambitious objectives - on employment, innovation, education, social inclusion and climate/energy - to be reached by 2020. Each Member State has adopted its own national targets in each of these areas. Concrete actions at EU and national levels underpin the strategy (European Union): [http://ec.europa.eu/europe2020/index_en.htm](http://ec.europa.eu/europe2020/index_en.htm)

5. **It's a smart world**. Economist, November, 2010. The real and the digital worlds are converging, bringing much greater efficiency and lots of new opportunities. But is it what people want? WHAT if there were two worlds, the real one and its digital reflection? The real one is strewn with sensors, picking up everything from movement to smell. The digital one, an edifice built of software, takes in all that information and
automatically acts on it. If a door opens in the real world, so does its virtual equivalent. If the temperature in the room with the open door falls below a certain level, the digital world automatically turns on the heat.

6. **Central Nervous System for the Earth (CeNSE)**. We create the mathematical and physical foundations for the technologies that will form a new information ecosystem, the Central Nervous System for the Earth (CeNSE), consisting of a trillion nanoscale sensors and actuators embedded in the environment and connected via an array of networks with computing systems, software and services to exchange their information among analysis engines, storage systems and end users. A central nervous system for the Earth is to gather information and send it to the “brain” (cloud computing). 1 trillion nanoscale sensors and actuators networks will need 1000 internets. (HP)

**SMART/INTELLIGENT CITY MODELS**

Intelligent communities and cities belong to an emerging movement targeting the creation of environments that improve cognitive skills and abilities to learn and innovate. They represent environments that enable superior cognitive capabilities and creativity to be collectively constructed from combinations of individual cognitive skills and information systems that operate in the physical, institutional, and digital spaces of cities.

A roadmap strategy with the implementation plan for building a smart sustainable city as a model community for wellbeing and quality of life, characterized by Creative Education, Research, Innovation, Productive Entrepreneurship, Intelligent Lifestyle, Smart City Management, and Sustainable Environment.

A master-planned iconic township of the 21st century is trademarked as “Smart Eco City™”, modeled as the paradigm community to live, to work, to learn and to visit. The viability of the holistic conception is validated by converging the most valuable concepts and practices of digital/smart cities, ecological communities, intelligent cities and knowledge clusters.

The “Smart Sustainable City™” makes a unified project of three innovative cities, as three critical layers/levels planned, managed and coordinated as integral multi-projects:

- **Digital/ICT/Hi-Tech/Ubiquitous/Cyber City** (Multi-Play Telecom Network, ICT spaces/systems/applications, Ubiquitous Computation, Network-integrated Real Estate, Virtual Lifestyle)
- **Sustainable/Ecological/Green/Zero-Carbon/Zero-Waste/Eco Friendly/Solar City** (Green Energy Network, Real Eco Estate, Green Lifestyle)
- **Knowledge/Learning/Innovation/Intelligent/Science/Intellectual/LivingLab/Creative/Human City/Noopolis** (Knowledge Triangle/Square/Grid/Ecology, Intelligent Management Platform/Smart Lifestyle)

The development stages are defined as the self-sustaining lifecycle: Conception (Modeling, Vision, Mission) > Analysis (Initiation, Preparation; business analysis, financial analysis, stakeholder analysis, project charter, etc.) > Planning and Design (Schematic design, LLD, HLD, Detailed Design; WBS)> Implementation (Execution, Construction, Manufacturing, Production) > Launch and Operation > Monitoring and Control > Closing > Smart Inclusive Growth >...

As a proof the overall concept of the Smart/Intelligent Eco City Development, *Neapolis Smart EcoCity* has been originated as a fully sustainable city model and prototype, which is currently under development, with the building cost of EUR 2.5 billion, and estimated GDV as exceeding EUR 4 billion.

The Study set forth a Standard Smart Development Framework for constructing a Sustainable Community of any size and level: local, national, international or global. The Communities of the Future have been modeled as a Smart Sustainable Community™ of different types, scales and levels:

- Sustainable Community™
- Sustainable City™, Eco City, Eco-Smart City™, Eco-Intelligent City™
- Smart City, Intelligent City
- Smart/Intelligent EcoCity™, Smart EcoCity™, Smart Eco City™, Intelligent EcoCity™, Intelligent Eco City™, Smart Sustainable City™, Intelligent Sustainable City™, Smart Green City™, Intelligent Green City™,

EIS Encyclopedic Intelligent Systems/SMART GROUP © 2011 Azamat Abdoullaev
Thus, basing on a Comprehensive Sustainable Development Framework, general models of Intelligent Europe, Sustainable Russia, Smart Cyprus, as well as Sustainable Cities have been developed.

Another critical innovation, the Study shows how to build a Smart Sustainable City, starting from its conception and modeling, design and planning, construction and implementation, continued with its territorial growth and expansion.

The proposed model of the Sustainable World of smart green communities is to set standards for the Europe 2020 strategic priorities of smart, sustainable, and inclusive growth, as well as for the global industrial initiatives, such as the IBM’s Smarter Planet and Cisco’s Smart + Connected Communities. (EIS Encyclopedic Intelligent Systems Ltd), http://www.eis.com.cy

10. Smart + Connected Communities Institute: http://www.smartconnectedcommunities.org/index.jspa

11. Hans Schaffers1, Nicos Komninos, Marc Pallot, Brigitte Trousse, Michael Nilsson, Alvaro Oliveira. Smart Cities and the Future Internet: Towards Cooperation Frameworks for Open Innovation. Cities nowadays face complex challenges to meet objectives regarding socio-economic development and quality of life. The concept of “smart cities” is a response to these challenges. This paper explores “smart cities” as environments of open and user-driven innovation for experimenting and validating Future Internet-enabled services. Based on an analysis of the current landscape of smart city pilot programmes, Future Internet experimentally-driven research and projects in the domain of Living Labs, common resources regarding research and innovation can be identified that can be shared in open innovation environments. Effectively sharing these common resources for the purpose of establishing urban and regional innovation ecosystems requires sustainable partnerships and cooperation strategies among the main stakeholders.

12. Juan Andrés Alonso González, Andrea Rossi, 2011. New Trends for Smart Cities. The purpose of this document is to analyze trends and identify the most representative and promising technologies and firms’ solutions around the concept of Smart Cities at a global level. It has been divided in different sections that include, among other information, a definition of what a Smart City is, an overview on currently running smart Research, Development & Innovation (R&D&I) projects, and technological solutions offered by various ICT players. A Smart City is defined as a public administration or authorities that delivers (or aims to) a set of new generation services and infrastructure, based on information and communication technologies. Defining new generation service is nevertheless a bit more complex and broader as the systems and services provided by smart cities should be easy to use, efficient, responsive, open and sustainable for the environment. The Smart City concept brings together all the characteristics associated with organizational change, technological, economic and social development of a modern city. Smart City services and infrastructures as well entail the characteristics of engaging and interacting with the citizens that made use of them. Another central element is the adaptive nature of services, ICT systems, infrastructures, buildings that comprehends the Smart City concept. (EU CIP Framework Programme)

13. Knowledge Cities for Future Generations. The 4th Knowledge Cities World Summit (KCWS 2011). The era of knowledge economy, globalization and technological advancements have been influencing and transforming our cities, societies and lifestyles. In recent years, the trio of “knowledge economy, globalization and technology” have also had an enormously significant effect on the way we generate, attain and spread knowledge not only in the professional circles that mostly impact adult populations, but also in the social circles that impact our children and youth as well as adults. For that reason, this year’s Summit particularly focuses on the theme of ‘Knowledge Cities for Future Generations’. As it appears in our summit logo – children's building blocks composing the ancient ‘Tree of Knowledge’ – we believe that on the one hand, knowledge can be generated and then used for building a sustainable future for our children, and on the other, it can also be created by the involvement of our children.

CORPORATE REPORTS ON SMART CITIES

14. Smart + Connected Communities: Changing a City, a Country, the World. "Cisco Smart + Connected Communities uses intelligent networking capabilities to weave together people, services, community assets, and information into a single pervasive solution. "Smart + Connected" acknowledges the essential role of the network as the platform to help transform physical communities to connected communities. It also encapsulates a new way of thinking about how communities are designed, built, managed, and renewed to achieve social, economic, and environmental sustainability. Cisco's Smart+Connected Communities helps transform physical communities into connected communities that can help: Realize sustainable economic growth; Enable environmental sustainability through resource management and operational efficiencies; Enhance quality of life Smart+Connected Communities provide "Community + Connect" experience for the constituents (residents and business) as well as a "Community +
Exchange” for those who manage the community. We understand how important it is for governments and their private sector partners to ensure a thriving, safe community where constituents are free to live, work, learn, and play. Constituents of Smart + Connected Communities have access to information and services that enrich their lives, with solutions for their home, schools, transportation, and more. We call this the "Community + Connect" experience. We understand how important it is for governments and their private sector partners to foster a thriving, safe community where constituents are free to live, work, learn, and play. Cisco has created solutions that can help with the planning, and day-to-day operations and management of a community. We refer to this as "Community + Exchange" (Cisco’s Systems). [http://www.cisco.com/web/strategy/smart_connected_communities.html](http://www.cisco.com/web/strategy/smart_connected_communities.html)

15. Building and Managing an Intelligent City. How new strategies, technologies, open platforms and effective governance can help create cities that are sustainable and attractive to ongoing development. A city capable of becoming both environmentally sustainable and attractive to citizens and businesses requires a new kind of intelligent infrastructure—an innovative, open platform based on smart technologies that can help forward-looking cities more predictably integrate a complex suite of services cost-effectively, at pace and at scale. (Accenture).

16. Making Cities Smart and Sustainable. The success of smart city initiatives will require the creative application of technology coupled with novel public policy initiatives. It demands levels of collaboration among private and public institutions far deeper than any seen to date. It also requires the extensive and creative application of innovation in terms of technology, public policy, finance, and governance. Smart cities by definition will involve strong public-private partnerships, engaging the active participation of governments (regional and local), private companies, educational and research institutions, entrepreneurs, and civic organizations. There is a tremendous opportunity before us, if we act smartly (and quickly). Urbanization cannot continue on its current path. The smart city vision offers an opportunity to chart a more sustainable course and to potentially eliminate some of the inequalities in broadband access that exist today. This is the right time to fashion a more sustainable, inclusive, and economically vibrant approach to urban growth. Let us take advantage of it. (Alcatel-Lucent).

17. Smart Home, Smart City. Werden Gebäude und ihre Systeme wie Beleuchtung, Heizung oder Klimaanlagen zentral gesteuert, wird der Betrieb effizienter und der Energieverbrauch sinkt – dies belegen bereits etliche Bauten, für die Siemens eine Gebäudeautomation installiert hat. Zugleich forscht das Unternehmen an intelligenten Sensornetzwerken, die den Weg vom Smart Home zur Smart City bereiten. “Complete Mobility”.

With its “Complete mobility” solutions, Siemens has answers to the challenges of growing global population, urbanization, climate change and resource conservation. To ensure mobility in the future, we need closely networked transportand information systems. Whether transport takes place within urban centers or in cities and countries – the multiplechallenges can only be mastered if all transport modes are sensibly coordinated and function smoothly.

To meet these needs, Siemens offers integrated mobility solutions that ensure safe, economical and environmentally compatible passenger and freight transport. Siemens has all the necessary experience and expertise for the job – ranging from operating systems for rail and tram systems, rail electrification systems, rolling stock for mass transit, regional and long-distance rail lines, to airport logistics and postal automation systems. (Siemens AG).

18. Smart Cities: true icons of the 21st century. Throughout the world real estate is going through a major transformation. New cities are being created where the network and services running through them are integral to the design and day to day use. Technology will improve life for the office worker and resident alike, enhance building performance and conserve energy. The Orange vision of the Smart City is an environment designed to attract knowledge and talent from around the world and to spur innovation and creativity. The goal of the smart city is to promote education, art, science, medicine, industry, environment conservation, transportation, social
communications and public administration to enhance urban life. In Smart Cities people will move around, learn, consume and interact through the use of advanced technologies that have a social dimension, are location-aware, mobile and reactive. Smart Cities are emerging partly because the oil wells that are funding the buzzing Middle East industry are not bottomless: governments in the Gulf are looking for new wealth generated from commerce and tourism to pay back their investment in the new smart built environment. It has become clear to developers and investors that technology can be a key differentiator to put clear blue water between them and their competitors. The truly Smart City is not just a dream: the technology already exists. The challenge is to pull it all together into a unified, easily-managed environment. Cutting-edge engineering projects like Dubai’s Palm Islands with its artificial islands created from sand sprayed into the sea won’t stay unique for long. A great view or a prime site helps, but in a building boom that has brought unprecedented competition for landlords and property developers, there is one other essential for attracting new business: access to broadband services, on every floor of every building, in homes and offices, shopping malls and civic centers. Now real estate investors have a new option. In addition to selling units and facilities within the real estate campus, they can also deliver the converged broadband telecommunications services as the 4th utility (after electricity, gas and water) and gain revenue from the services occupiers want and they can enjoy a higher return on their investment and achieve higher sale prices for their properties. In the Smart City big broadband is as important as the roads, supporting entertainment, information and business communications. A Smart City requires a high capacity backbone network to support future demand: and fiber terminated on each floor of every building so that whenever and wherever services are needed they can be simply and quickly activated. Using IP technology a fiber network will carry information systems to facilitate the automation, centralization and remote monitoring of essential building services, making these cities easier, cheaper and more energy efficient. Additional services can then be accessed without digging up roads or rewiring. Fiber is just the foundation for a range of advanced services that can be layered over the top. Customers of all types, including residents, facilities managers, retailers, corporates, small and medium businesses and hoteliers can share the same single converged IP infrastructure supporting video, voice and data services for different terminals over mobile and fixed line access technologies across an entire development. (France Telecom, Orange)

19. Is Your City Smart Enough? Digitally enabled cities and societies will enhance economic, social, and environmental sustainability in the urban century. The terms "smart" and "intelligent" have become part of the language of urbanization policy, referring to the clever use of IT to improve the productivity of a city’s essential infrastructure and services and to reduce energy inputs and CO2 outputs in response to global climate change. However, some "smart" and "intelligent" initiatives will no doubt turn out to be neither. Ovum prefers to use the more value-neutral term "digital." We see two broad streams of digital enablers in cities. The first, digital-city strategies, are the formal/inside-out projects which provide new ways for public authorities and developers to architect and build more efficient infrastructure and services. Digital-city strategies include such things as IP network infrastructure, e-government/gov2.0 services, and the digitization of processes and systems in urban planning, transport, healthcare, education, utilities, and buildings. The second, digital-society initiatives, are more emergent/outside-in. They stimulate self-help and co-production behaviors in the community, strengthen social capital, and engender digital inclusion. These complement public services, but also hold them to account. Digital-society initiatives include such things as: urban action forums (www.greatcities.org), service interfaces (www.fixmystreet.com), hyper-local websites (www.everyblock.com), support networks (www.tyze.com), volunteering networks (www.volunteerhq.org), collective action forums (www.pledgebank.com), carpooling networks (www.zimride.com), social innovation incubators (www.mysociety.org), digital divide programs (www.digitaldivide.org), and the use of social network platforms, such as Facebook, to form communities and mobilize local action. Together, formal digital-city and emergent digital-society initiatives offer the prospect of making cities more livable and sustainable even as they become more densely populated. (Ovum/Datamonitor Group)

20. Brilliant life powered by Smart City. A Smart City efficiently handles the information boom and creates value across many sectors. Based on a combination of virtual and physical infrastructure and intelligent functions powered by network and IT technologies, Smart City offers a perfect lifestyle choice for individual users. The Smart City concept includes Digital City and Wireless City. In a nutshell, a Smart City describes the integrated management of information that creates value by applying advanced technologies to search, access, transfer, and process information. A Smart City encompasses e-Home, e-Of f i c e , e-Government, e-Health, e-Education and e-Traffic. A Smart City is purported to be the fourth in size and importance when it comes to infrastructure after water, electricity and natural gas. The availability of information in a Smart City represents an important standard that measures a city or even a country’s ICT level, international competitiveness and influence. (Huawei)

21. Smart Cities. Municipal Networking, Communications, Traffic/Transportation, and Energy. Many municipalities are exploring the Smart City concept. They may be installing municipal wireless networks; implementing e-government initiatives by providing access to city departments and initiatives through web sites; integrating public transportation with Intelligent Transportation Systems; or developing ways to cut their carbon footprints and reduce the amount of recyclables that are consigned to the trash heap. This study clarifies the meaning of the term "Smart City" through an examination of more than 50 actual Smart City
projects around the world. It also provides insights and data from a range of ABI Research studies that cover many of the technologies that can be used to make a municipality and its various agents more communicative and responsive to its citizenry, while allowing its transportation and other infrastructures to use energy more efficiently and cost-effectively. (ABI Research)

22. **Smart Cities**. Intelligent Information and Communications Technology Infrastructure in the Government, Buildings, Transport, and Utility Domains. For the first time in human history, more people live in cities than in rural areas and in the next 20 years the urban population will grow from 3.5 billion to 5.0 billion people. The social, economic, environmental, and engineering challenges of this transformation will shape the 21st century. The lives of the people living in those cities can be improved – and the impact of this growth on the environment reduced – by the use of “smart” technologies that can improve the efficiency and effectiveness of urban systems. The smart city can be defined as the integration of technology into a strategic approach to sustainability, citizen well-being, and economic development. While there are many innovative pilot projects and small-scale developments that are looking at the smart city from a holistic perspective, there are no examples yet of a smart city that supports hundreds of thousands, never mind millions, of people. The smart city offers a coherent vision for bringing together innovative solutions that address the issues facing the modern city, but there are many challenges still to be faced. If the smart city is to truly become a blueprint for urban development, then a number of technical, financial, and political hurdles will need to be met. (Pike Research).

23. **The Smart Solutions for Cities**. Smart cities are not simply those that deploy ICT. They combine new technology with smart new ways of thinking about technologies’ role in organisation, design and planning. Arup recommends that city leaders, as they plan smart city initiatives, envision ways that technology can create new urban user experiences; think about the smart city as a holistic system; and consider ways that new systems can result in positive behavioral change. A smart city is one that uses technology to transform its basic infrastructure and optimise energy and resource usage. Arup specialists recommend a smart city development strategy that rests on three interlinked components: leadership, urban informatics, and systems architecture (Arup UrbanLife).

24. Rosabeth Moss Kanter, Stanley S. Litow, 2009, *Informed and Interconnected: A Manifesto for Smarter Cities*. The need for a fresh approach to U.S. communities is more urgent than ever because of the biggest global economic crisis since the Great Depression. Through examination of the barriers to solving urban problems (and the ways they reinforce each other), this paper offers a new approach to community transformation which calls for leaders to use technology to inform and connect people. We need to convert the social safety net into a social safety network through the creation of smarter communities that are information-rich, interconnected, and able to provide opportunities to all citizens. Realization of the vision requires leaders to invest in the tools, guide their use, and pave the way for transformation. Perhaps the urgency of the current economic crisis can provide the impetus to overcome resistance to change and turn problems into an opportunity to reduce costs, improve services to communities, and make our cities smarter. (Harvard Business School).

25. **Building Sustainable Cities. Cities in the Cloud.** (Living PlanIT).

In order to demonstrate technological innovation at urban scale Living PlanIT will soon break ground at a 1,700 hectare (4,000 acre) Greenfield site in the municipality of Paredes outside Porto, Portugal. This is the initial phase in the construction of the first of a new generation of intelligent cities – PlanIT Valley.

At the core of Living PlanIT’s approach is an integrated platform for managing city operations. The high-level convergence of information and control systems with the fabric of buildings, infrastructure, places and mobility is critical to being able to respond holistically to the challenges posed by urbanization and associated issues of environmental sustainability. The convergence of manufacturing processes and enabling technologies is delivered through Living PlanIT and Cisco's ecosystem of partners. Living PlanIT has developed several strategic and patented platforms. This requires but is not limited to the following: Convergence of manufacturing technologies in construction; Convergence of Information Communications Technology (ICT) into the construction design; Convergence of Utility and Telecommunications infrastructures. [http://living-planit.com/default.htm](http://living-planit.com/default.htm)
FRAGMENTED SMART CITY PROJECTS

   Smart Economy: Holyoke, Massachusetts
   Smart Economy: Kochi, India
   Smart Economy: Malta
   Smart Economy: Manado, Indonesia
   Smart Economy: Nanjing, China

2. Smart Environment (Natural Capital and Resources, Sustainable Resource Management)
   Smart Environment: Amsterdam, Netherlands
   Smart Environment: Burlington, Ontario
   Smart Environment: Dublin, Ireland
   Smart Environment: Dubuque, Iowa
   Smart Environment: Glasgow, Scotland, United Kingdom
   Smart Environment: Lyon, France
   Smart Environment: Malaga, Spain
   Smart Environment: Peterborough, United Kingdom
   Smart Environment: San Diego, California
   Smart Environment: Shenyang, China
   Smart Environment: Santa Barbara, California
   Smart Environment: Stockholm, Sweden
   Smart Environment: Sydney, Australia
   Smart Environment: Yokohama, Japan

3. Smart Governance (e-Participation, public/social services, transparency, political strategies and perspectives)
Smart Governance: Chengdu, China
Smart Governance: Edinburgh, United Kingdom
Smart Governance: Matosinhos, Portugal
Smart Governance: Syracuse, New York
Smart Governance: Wilmington, North Carolina

4. Smart Lifestyle (Smart Living, Quality or Life)
Smart Lifestyle: Boise, Idaho
Smart Lifestyle: Houston, Texas
Smart Lifestyle: Johannesburg, South Africa

5. Smart Transportation (Smart Mobility, innovative, safe and sustainable transport systems and facilities)
Smart Transportation: Alameda County, California
Smart Transportation: Alcoa, Tennessee
Smart Transportation: Portland, Oregon
Smart Transportation: Southampton, United Kingdom

6. Smart Community (Social Cohesion, Unity in Community, Human Infrastructure, Interfaces, Integration)
Smart Community: Chattanooga, Tennessee
Smart Community: Dublin, Ohio
Smart Community: Eindhoven, the Netherlands
Smart Community: Issy-les-Moulineaux, France
Smart Community: Luxembourg
Smart Community: Queensland, Australia
Smart Community: Stratford, Ontario, Canada
Smart Community: Windsor-Essex, Ontario, Canada

GREEN INNOVATION: ENVIRONMENTAL/ECOLOGICAL/GREEN/CLEAN TECHNOLOGIES
(Cleantech, Greentech, Envirotech)
Renewable Energy Technologies: (Bioenergy (Biomass, Biofuel, Biogas), Solar Power, Geothermal, Wind Power, Ocean (Wave/Tidal) Power, Hydropower); Carbon Capture and Storage Technologies, Distributed Renewable Management (Smart Grids, Energy-Efficient Systems).
Transport, Electricity, Heating, and Cooling.

Education & Training
An educated and skilled population is needed to create, share and use knowledge.

Information Infrastructure
A dynamic information infrastructure-ranging from radio to the internet-is required to facilitate the effective communication, dissemination and processing of information.

Economic Incentive & Institutional Regime
A regulatory and economic environment that enables the free flow of knowledge, supports investment in Information and Communications Technology (ICT), and encourages entrepreneurship is central to the knowledge economy.

Innovation Systems
A network of research centers, universities, think tanks, private enterprises and community groups is necessary to tap into the growing stock of global knowledge, assimilate and adapt it to local needs, and create new knowledge.
