### How fast read and write operations in MWMR atomic register implementations can be?

Nicolas Nicolaou

University of Cyprus & University of Connecticut

Funded by the Cyprus Research Promotion Foundation and co-funded by the Republic of Cyprus and the European Regional Development Fund

### What is a Distributed Storage System?

Distributed Storage Abstraction

- ▶ Data Replication – Servers/Disks
  - ▶ Survivability and Availability
- ▶ Read/Write operations
- ▶ Consistency Semantics

▶ 2 Nicolas Nicolaou -- ΠΕΝΕΚ/0609/31 23/2/2011

### Consistency Semantics [Lamport86]

Safety

Regularly

Atomicity

▶ 3 Nicolas Nicolaou -- ΠΕΝΕΚ/0609/31 23/2/2011

### Complexity Measure-Operation Latency

- ▶ Consistent Register Implementations
  - ▶ **Message-Passing, Asynchronous** model
  - ▶ Access **multiple replicas** per operation
  - ▶ Perform **multiple accesses** per operation

↓

Operation Latency is measured in **Communication Rounds (round-trips)**

▶ 4 Nicolas Nicolaou -- ΠΕΝΕΚ/0609/31 23/2/2011

### Model: Definitions

- ▶ **Asynchronous, Message-Passing model**
  - ▶ Process sets: writers  $W$ , readers  $R$ , servers  $S$  (replica hosts)
  - ▶ Reliable Communication Channels
  - ▶ Well Formedness
- ▶ **Environments:**
  - ▶ SWMR:  $|W|=1, |R| \geq 1$
  - ▶ MWMR:  $|W| \geq 1, |R| \geq 1$
- ▶ **Failures:**
  - ▶ Crash Failures
- ▶ **Correctness: Atomicity (safety), Termination (liveness)**

▶ 5 Nicolas Nicolaou -- ΠΕΝΕΚ/0609/31 23/2/2011

### Definition: Operation Relations

- ▶ **Precedence Relations for two operations  $\pi_1, \pi_2$ :**
  - ▶  $\pi_1$  **precedes**  $\pi_2$  if the response of  $\pi_1$  happens **before** the invocation of  $\pi_2$
  - ▶  $\pi_1$  **succeeds**  $\pi_2$  if the invocation of  $\pi_1$  happens **after** the response of  $\pi_2$
  - ▶  $\pi_1$  is **concurrent** with  $\pi_2$  if  $\pi_1$  **neither precedes nor succeeds**  $\pi_2$

▶ 6 Nicolas Nicolaou -- ΠΕΝΕΚ/0609/31 23/2/2011

## Definition: Quorum systems

- ▶  $Q_1, Q_2, Q_3$  are **quorums**
- ▶ **Quorum System** is the set  $\{Q_1, Q_2, Q_3\}$ 
  - ▶ Property: every pair of quorums intersects
- ▶ Every R/W operation communicates with a single quorum
- ▶ **Faulty Quorum**: Contains a faulty process

▶ 7

Nicolas Nicolaou -- ΠENEK/0609/31

23/2/2011

## Prior Work: Quorum Systems Examples

Majorities [Thomas79, Gifford79]

Matrix Quorums [VA92]

▶ 8

Nicolas Nicolaou -- ΠENEK/0609/31

23/2/2011

## Definition: Fastness

- ▶ A process  $p$  performs a **communication round** during an operation  $\pi$  if:
  - ▶  $p$  sends a message  $m$  to a set of servers for  $\pi$
  - ▶ Any server that receives  $m$  replies to  $p$
  - ▶ Once  $p$  receives responses from a single quorum completes  $\pi$  or proceeds to a next communication round
- ▶ **Fast Operation**
  - ▶ Completes at the end of its first round
- ▶ **Fast Implementation**
  - ▶ All operations are fast
- ▶ **Communication scheme**
  - ▶ Message delivery: **Servers to Clients**
  - ▶ No server to server or client to client communication

▶ 9

Nicolas Nicolaou -- ΠENEK/0609/31

23/2/2011

## Definition: Tag - $\langle$ Timestamp, $W$ $\rangle$ pair

- ▶ How can we order the written values?
  - ▶ **without clock synchronization**
  - ▶ **without assuming access to centralized clock** (e.g., GPS)
- ▶ **TAG** :  $\langle$ timestamp, wid $\rangle$  pair
  - ▶  $tag1 > tag2$  if either:
    - ▶  $tag1.timestamp > tag2.timestamp$ , or
    - ▶  $tag1.timestamp = tag2.timestamp$  AND  $tag1.wid > tag2.wid$
- ▶ **Writers assign tags to written values**
  - ▶ Writes  $\langle$ tags, value $\rangle$  pairs

▶ 10

Nicolas Nicolaou -- ΠENEK/0609/31

23/2/2011

## Algorithm: Simple

### Write Protocol: two rounds

- **P1**: Query a single quorum for the latest tag
- **P2**: Increment the timestamp in the max tag, and send  $\langle$ newtag,  $v$  $\rangle$  to a quorum

### Read Protocol: two rounds

- **P1**: Query a single quorum for the latest tag
- **P2**: Propagate  $\langle$ maxtag,  $v$  $\rangle$  to a single quorum

### Server Protocol: passive role

- Receive requests, update local timestamp (if  $msg.tag > server.tag$ ) and reply with  $\langle$ server.tag,  $v$  $\rangle$

▶ 11

Nicolas Nicolaou -- ΠENEK/0609/31

23/2/2011

## Example: Simple (write operations)

- ▶ Assume  $w_i > w_k$

▶ 12

Nicolas Nicolaou -- ΠENEK/0609/31

23/2/2011

### Example: Simple (write operations)

Assume  $w_i > w_k$

13 Nicolas Nicolaou -- ΠΕΝΕΚ/0609/31 23/2/2011

### Example: Simple (write operations)

Assume  $w_i > w_k$

14 Nicolas Nicolaou -- ΠΕΝΕΚ/0609/31 23/2/2011

### Example: Simple (read operation)

Assume  $w_i > w_k$

15 Nicolas Nicolaou -- ΠΕΝΕΚ/0609/31 23/2/2011

### Example: Simple (read operation)

Assume  $w_i > w_k$

Operation Ordering:  $w_k \rightarrow w_i \rightarrow r_i$

16 Nicolas Nicolaou -- ΠΕΝΕΚ/0609/31 23/2/2011

### Why a read performs 2 rounds?

Consider the following executions with **single round** reads:

17 Nicolas Nicolaou -- ΠΕΝΕΚ/0609/31 23/2/2011

### Why a read performs 2 rounds? (Cont.)

Extend the second execution with a read from  $r_j$ :

Folklore Belief: **Reads must Write in MR environments**

18 Nicolas Nicolaou -- ΠΕΝΕΚ/0609/31 23/2/2011

## Question

Can we allow **some** reads to be **fast** (single round reads) and still guarantee atomicity?

Answer: **YES!!**

▶ 19

Nicolas Nicolaou -- PENEK/0609/31

23/2/2011

## Tool: Quorum Views

## Idea:

- ▶ Try to determine the state of the write operation based on the distribution of the latest value in the replied quorum.
- ▶ Write State in the First Round of Read Operation
  - Determinable => Read is **Fast**
  - Undeterminable => Read is **Slow**

▶ 20

Nicolas Nicolaou -- PENEK/0609/31

23/2/2011

## Determinable Write - Qview(1)

- ▶ All members of a quorum contain the maxTag

(Potentially) Write Completed

▶ 21

Nicolas Nicolaou -- PENEK/0609/31

23/2/2011

## Determinable Write - Qview(2)

- ▶ Every intersection contains a member with tag <maxTag

(Definitely) Write <maxTag,v> Incomplete

▶ 22

Nicolas Nicolaou -- PENEK/0609/31

23/2/2011

## Undeterminable Write - Qview(3)

- ▶ There is intersection with all its members with tag=maxTag

qV(3) and Incomplete Write

qV(3) and Complete Write

Undeterminable => second Com. Round

▶ 23

Nicolas Nicolaou -- PENEK/0609/31

23/2/2011

## Algorithm: CWFR

## Traditional Write Protocol: two rounds

- P1: Query a single quorum for the latest tag
- P2: increment the max tag, send <newtag, v> quorum

## Read Protocol: one or two rounds

- Iterate to discover smallest completed write
- P1: receive replies from a quorum Q
  - QView<sub>Q</sub>(1) – **Fast**: return maxTag of current iteration
  - QView<sub>Q</sub>(2) – **remove servers with maxTag and re-evaluate**
  - QView<sub>Q</sub>(3) – **Slow**: propagate and return maxTag

## Server Protocol: passive role

- Receive requests, update local timestamp and return <tag,v>

▶ 24

Nicolas Nicolaou -- PENEK/0609/31

23/2/2011

## Quorum Views and Multiple Writers

- ▶ MWMR environment
  - ▶ Concurrent writes
  - ▶ Multiple **concurrent values**
- ▶ For tags  $\langle 1, * \rangle$ ,  $\langle 2, * \rangle$ ,  $\langle 3, * \rangle$

▶ 25

Nicolas Nicolaou -- ΠΕΝΕΚ/0609/31

23/2/2011

## Idea: Predict the Past

- ▶ Discover the **latest potentially completed write**
- ▶ For tags  $\langle 1, * \rangle$ ,  $\langle 2, * \rangle$ ,  $\langle 3, * \rangle$  :
  - ▶  $\langle 3, * \rangle$  **not completed** (servers **possibly** contained  $\langle 2, * \rangle$ )
  - ▶  $\langle 2, * \rangle$  **not completed** (servers **possibly** contained  $\langle 1, * \rangle$ )
  - ▶  $\langle 1, * \rangle$  **potentially completed**

▶ 26

Nicolas Nicolaou -- ΠΕΝΕΚ/0609/31

23/2/2011

## Read Iteration: Discard Incomplete Tags

- ▶ For tags  $\langle 1, * \rangle$ ,  $\langle 2, * \rangle$ ,  $\langle 3, * \rangle$  :
  - ▶  $\langle 3, * \rangle$  **not completed**: remove servers that contain  $\langle 3, * \rangle$
  - ▶  $\langle 2, * \rangle$  **not completed**: remove servers that contain  $\langle 2, * \rangle$
  - ▶  $\langle 1, * \rangle$  **potentially completed in  $Q_i$** 
    - ▶ **Qview(1)** : all remaining servers contain  $\langle 1, * \rangle$

▶ 27

Nicolas Nicolaou -- ΠΕΝΕΚ/0609/31

23/2/2011

## Read Iteration: Discard Incomplete Tags

- ▶ For tags  $\langle 1, * \rangle$ ,  $\langle 2, * \rangle$ ,  $\langle 3, * \rangle$  :
  - ▶  $\langle 3, * \rangle$  **not completed**: remove servers that contain  $\langle 3, * \rangle$
  - ▶  $\langle 2, * \rangle$  **potentially completed in  $Q_i$** 
    - ▶ **Qview(3)** : an intersection of the remaining servers contains  $\langle 2, * \rangle$
    - ▶ P2: propagate  $\langle 3, * \rangle$  to a complete quorum (help  $\langle 3, * \rangle$  to complete)

▶ 28

Nicolas Nicolaou -- ΠΕΝΕΚ/0609/31

23/2/2011

## What about writes?

Can we allow **any writes** to be **fast (single round reads)** and still guarantee atomicity?

**Answer: YES!!**

▶ 29

Nicolas Nicolaou -- ΠΕΝΕΚ/0609/31

23/2/2011

## New Technique - SSO

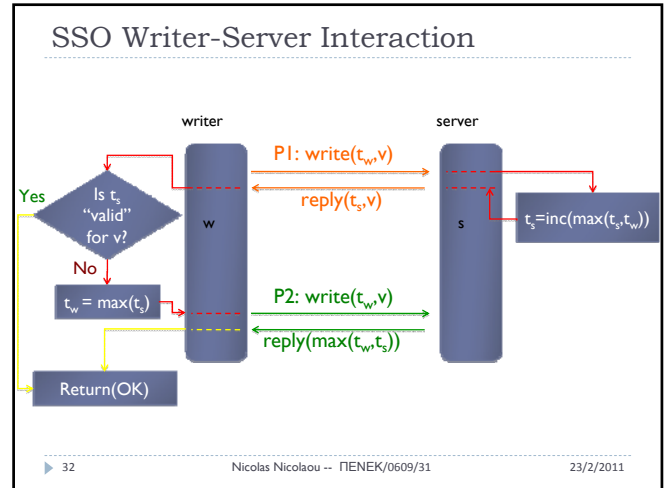

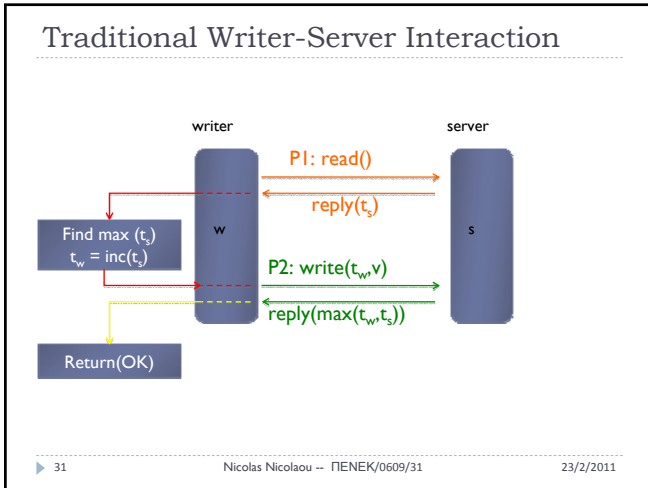

[Englert et. al 09]

- ▶ **SSO: Server Side Ordering**
  - ▶ Tag is incremented by the servers and not by the writer.
    - ▶ Generated tags may be different across servers
    - ▶ Clients decide operation ordering based on server responses
- ▶ **SSO Algorithm**
  - ▶ Enables **Fast Writes and Reads** -- **first such algorithm**
  - ▶ Allows **Unbounded Participation**

▶ 30

Nicolas Nicolaou -- ΠΕΝΕΚ/0609/31

23/2/2011

### Definition: n-wise Quorum Systems

**Definition:** A quorum system  $Q$  is an **n-wise quorum system**, if:

$$Q = \{Q : Q \subseteq S\} \text{ where } \forall A \subseteq Q : |A| = n \text{ and } \bigcap_{Q \in A} Q \neq \emptyset$$

33 Nicolas Nicolaou -- ΠΕΝΕΚ/0609/31 23/2/2011

### Predicates: Read and Write

**Writer predicate for a write  $\omega$  (PW):**  $\exists \tau, Q^i, MS$  where:  $\tau \in \{(\cdot, \omega) : \langle \cdot, \omega \rangle \in m(\omega)_{s,w}.inprogress \wedge s \in Q^i\}$ ,  $MS = \{s : s \in Q \wedge \tau \in m(\omega)_{s,w}.inprogress\}$ , and  $Q^i \subseteq Q, 0 \leq i \leq \lfloor \frac{n}{2} - 1 \rfloor$ , s.t.  $(\bigcap_{Q \in Q^i \cup \{Q\}} Q) \subseteq MS$ .

**Reader predicate for a read  $\rho$  (PR):**  $\exists \tau, Q^i, MS$ , where:  $\max(\tau) \in \bigcup_{s \in Q} m(\rho)_{s,r}.inprogress$ ,  $MS = \{s : s \in Q \wedge \tau \in m(\rho)_{s,r}.inprogress\}$ , and  $Q^i \subseteq Q, 0 \leq i \leq \lfloor \frac{n}{2} - 2 \rfloor$ , s.t.  $(\bigcap_{Q \in Q^i \cup \{Q\}} Q) \subseteq MS$ .

34 Nicolas Nicolaou -- ΠΕΝΕΚ/0609/31 23/2/2011

### Lower bounds

**Theorem:** No execution of safe register implementation that use an  $N$ -wise quorum system, contains more than  $N - 1$  consecutive, quorum shifting, fast writes.

**Theorem:** It is impossible to get MWMMR safe register implementations that exploit an  $N$ -wise quorum system, if

$$|W \cup R| > N - 1$$

35 Nicolas Nicolaou -- ΠΕΝΕΚ/0609/31 23/2/2011

### Remarks

**Remark:** SSO algorithm is near optimal since it allows up to  $\binom{N-1}{2}$  consecutive, quorum shifting, fast writes.

36 Nicolas Nicolaou -- ΠΕΝΕΚ/0609/31 23/2/2011

Problem: Communication vs Computation

**Theorem:** The read and write predicates are **NP-complete**. (provided a reduction from 3-SAT)
