

Fine-Grained Elasticity Support for Cloud Applications: The CELAR Approach

德正平

(Marios Dikaiakos)

University of Cyprus

Cloud Computing

- Ubiquitous, convenient, on-demand network access
- Shared pool of configurable resources
- Rapid provisioning and release
- Minimal management effort
- Minimal interaction with the service provider

The NIST Definition of Cloud Computing, NIST, 2011

Cloud Models

Service Models

- Software as a Service (SaaS)
- Platform as a Service (PaaS)
- Infrastructure as a Service (IaaS)

Deployment Models

- Private
- Community
- Public (IaaS)
- Hybrid

The NIST Definition of Cloud Computing, NIST, 2011

A Public Utility

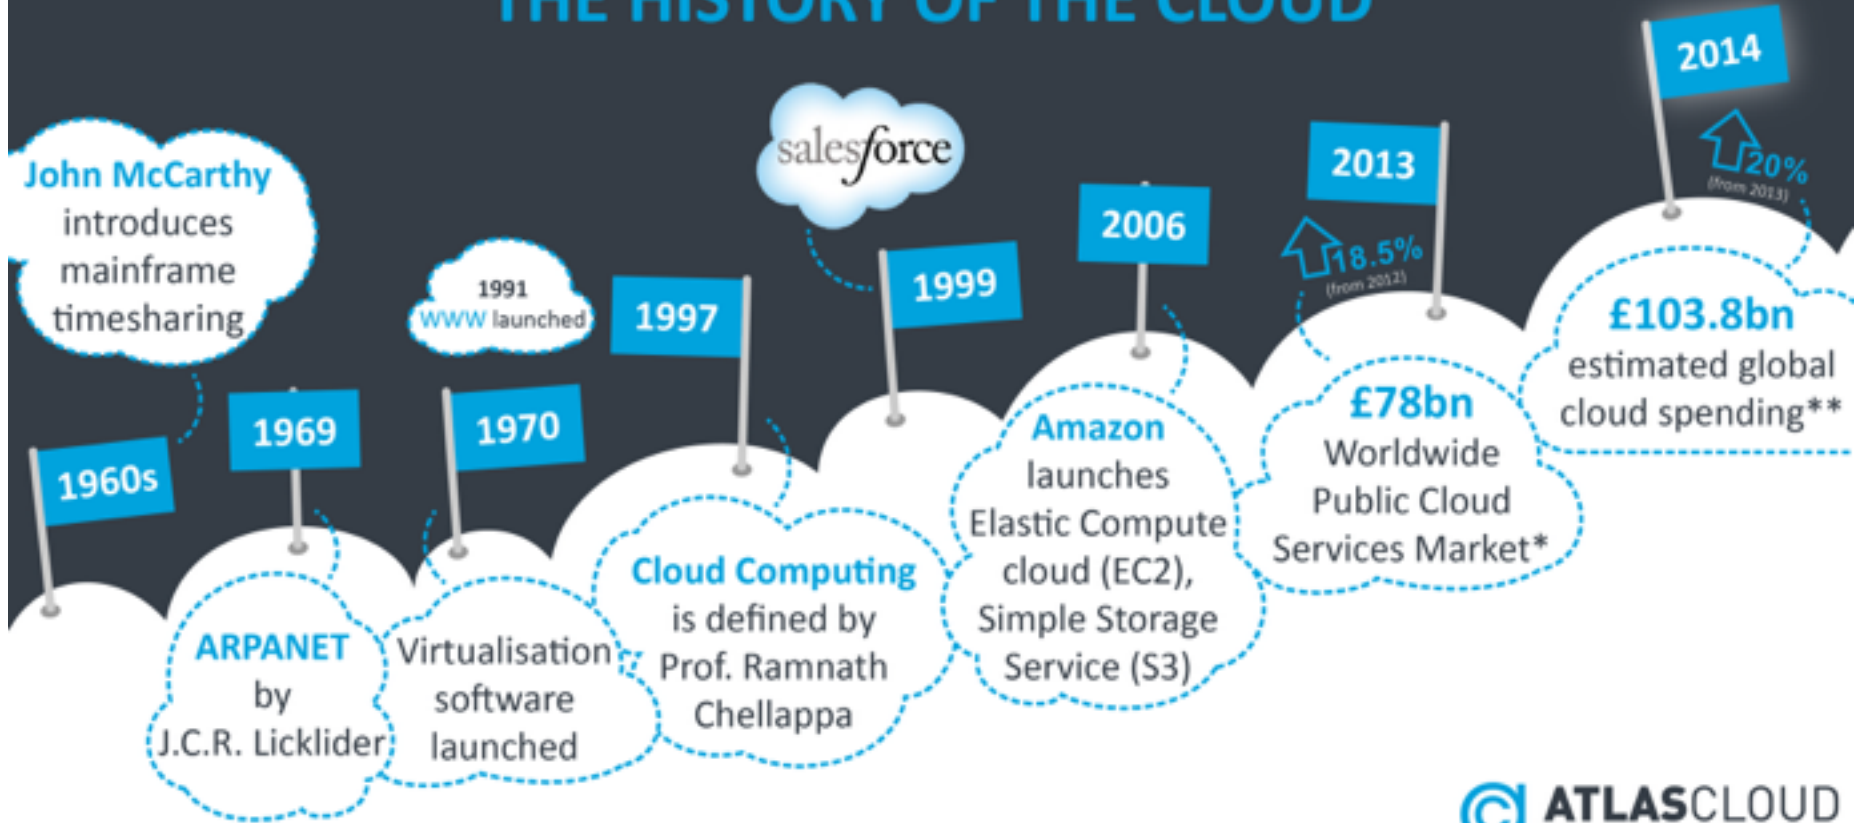

*(Cloud) Computing is
dubbed as the 5th utility*

R. Buyya et al., 2009

*...Computing may someday be organised as a public utility, just as the
telephone system is organised as a public utility...*

John McCarthy, 1961

OUTLINE

- Cloud Computing
- Main topics:
 - **Elasticity**
 - Application Management
- CELAR Architecture
- Elasticity and Monitoring - JCatascopia
- c-Eclipse and CAMF
- Conclusions

Elasticity

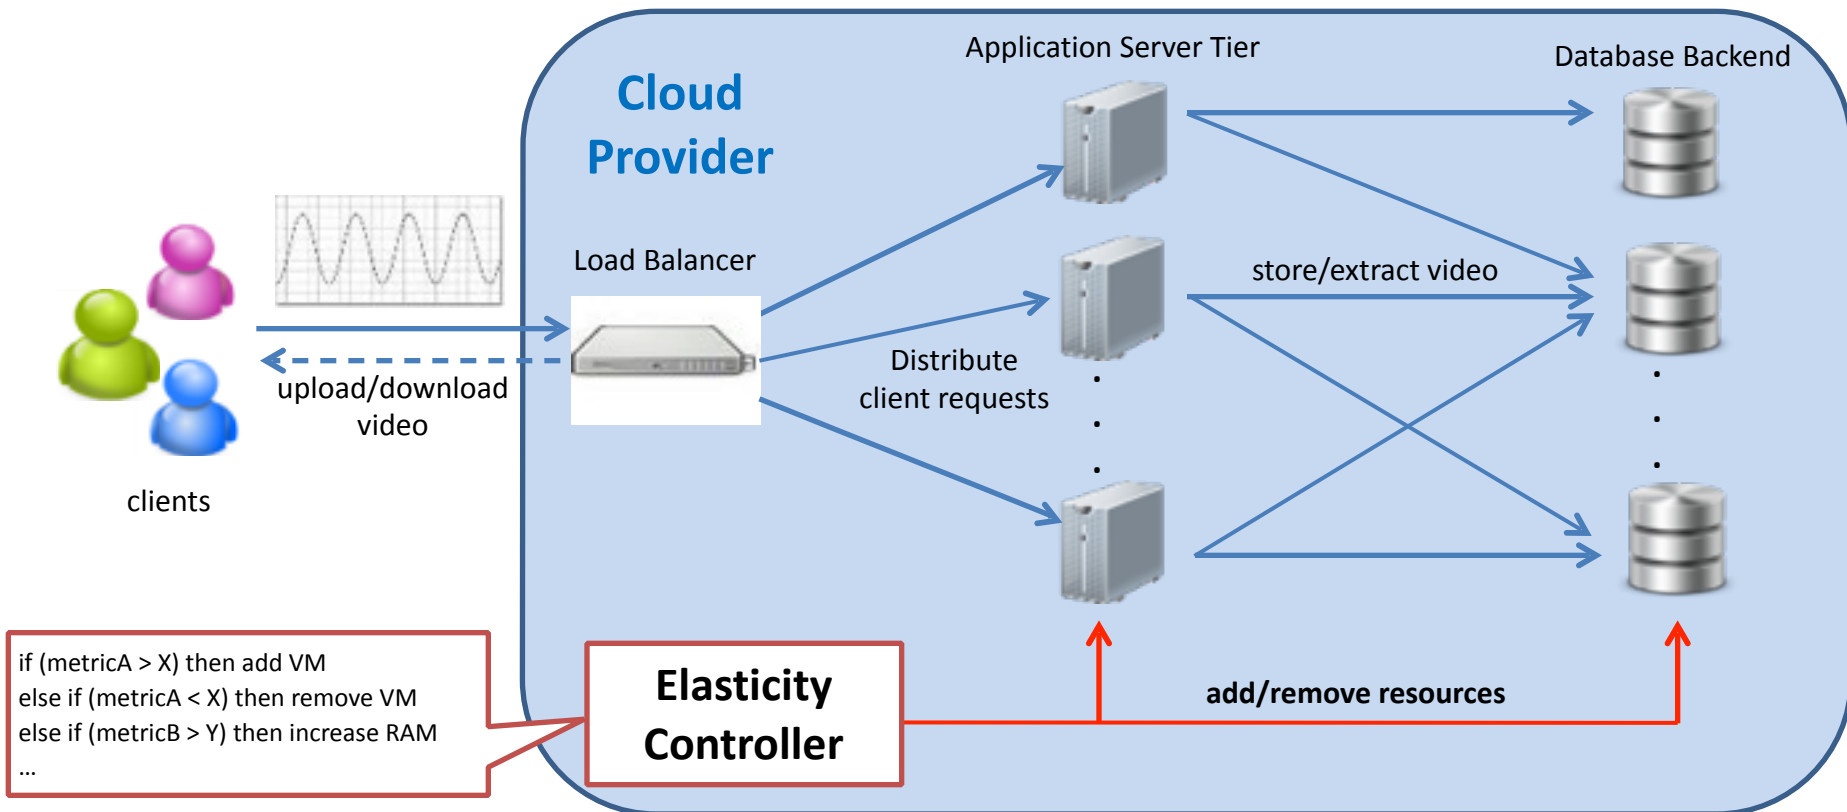

- Ability of a system to **expand** or **contract** its dedicated resources to meet the current demand

Three types of Elasticity

- **Horizontal**: On-demand provisioning
 - E.g.: Get more VMs
- **Vertical**: Resource re-configuration
 - E.g.: Main memory ballooning
- **Live Migration**:
 - E.g.: Move to another provider

Elasticity controller

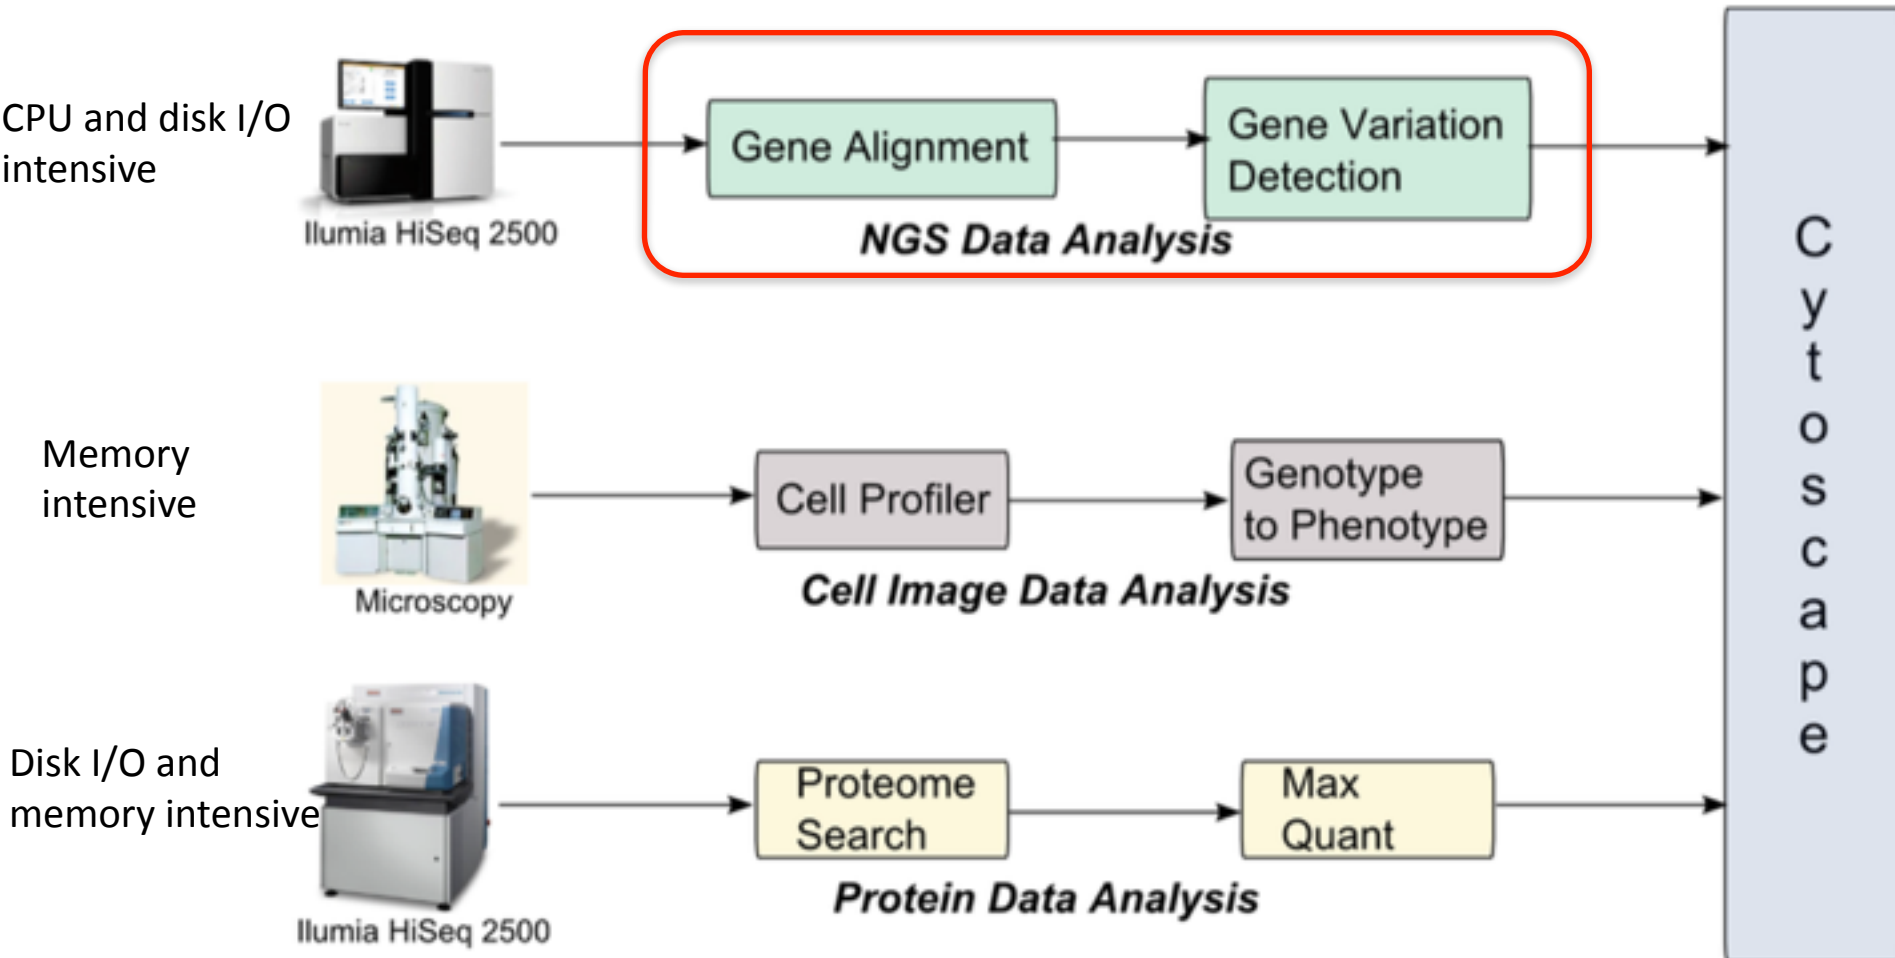

OUTLINE

- Cloud Computing
- Main topics:
 - Elasticity
 - **Application Management**
- CELAR Architecture
- Elastic Monitoring - JCatascopia
- c-Eclipse and CAMF
- Conclusions

Emerging cloud applications

- Increasing complexity
- Dynamic behaviour
- A variety of deployment platforms with different:
 - configuration mechanisms
 - offered services
 - availability and pricing
 - elasticity capabilities

Cloud application management challenges

- Time-consuming - requires manual effort
- Steep learning curve
- Relies on vendor-specific tools
- Offers limited portability
- Migration entails significant cost

“Enabling Interoperable Cloud Application Management through an Open Source Ecosystem”
Loulloudes, Sofokleous, Trihinas, Dikaiakos, and Pallis. IEEE Internet Computing, May/June 2015.

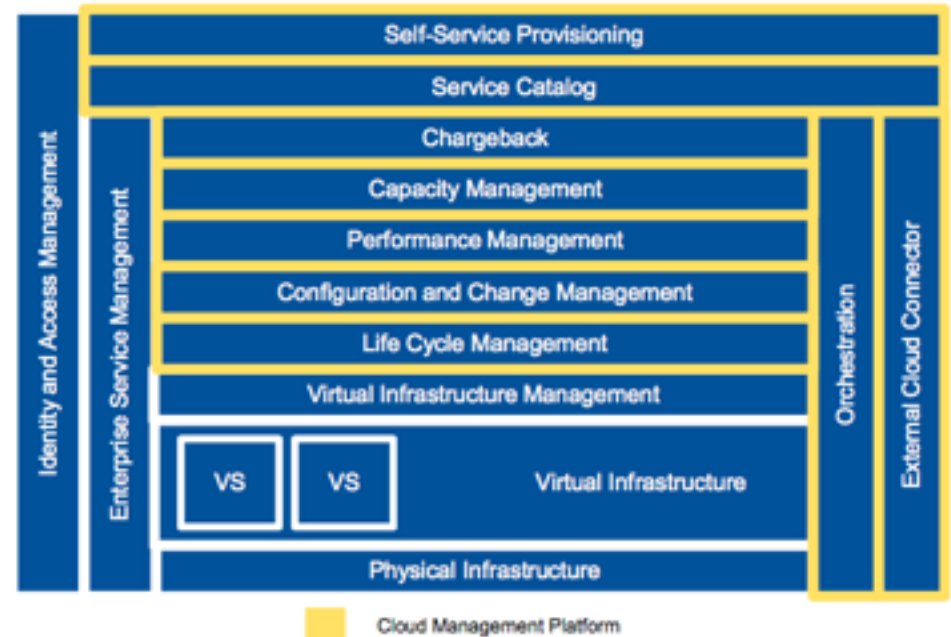

Cloud management platforms

- Integrated software stacks for the management of Cloud environments [Gartner]
- Goal: ease the description & deployment of applications over Cloud infrastructures
- A critical component to the overall success of a cloud initiative [Gartner, CMP Landscape, 2012]
- Expected to provide application portability: “define once, deploy anywhere”

Cloud management platforms

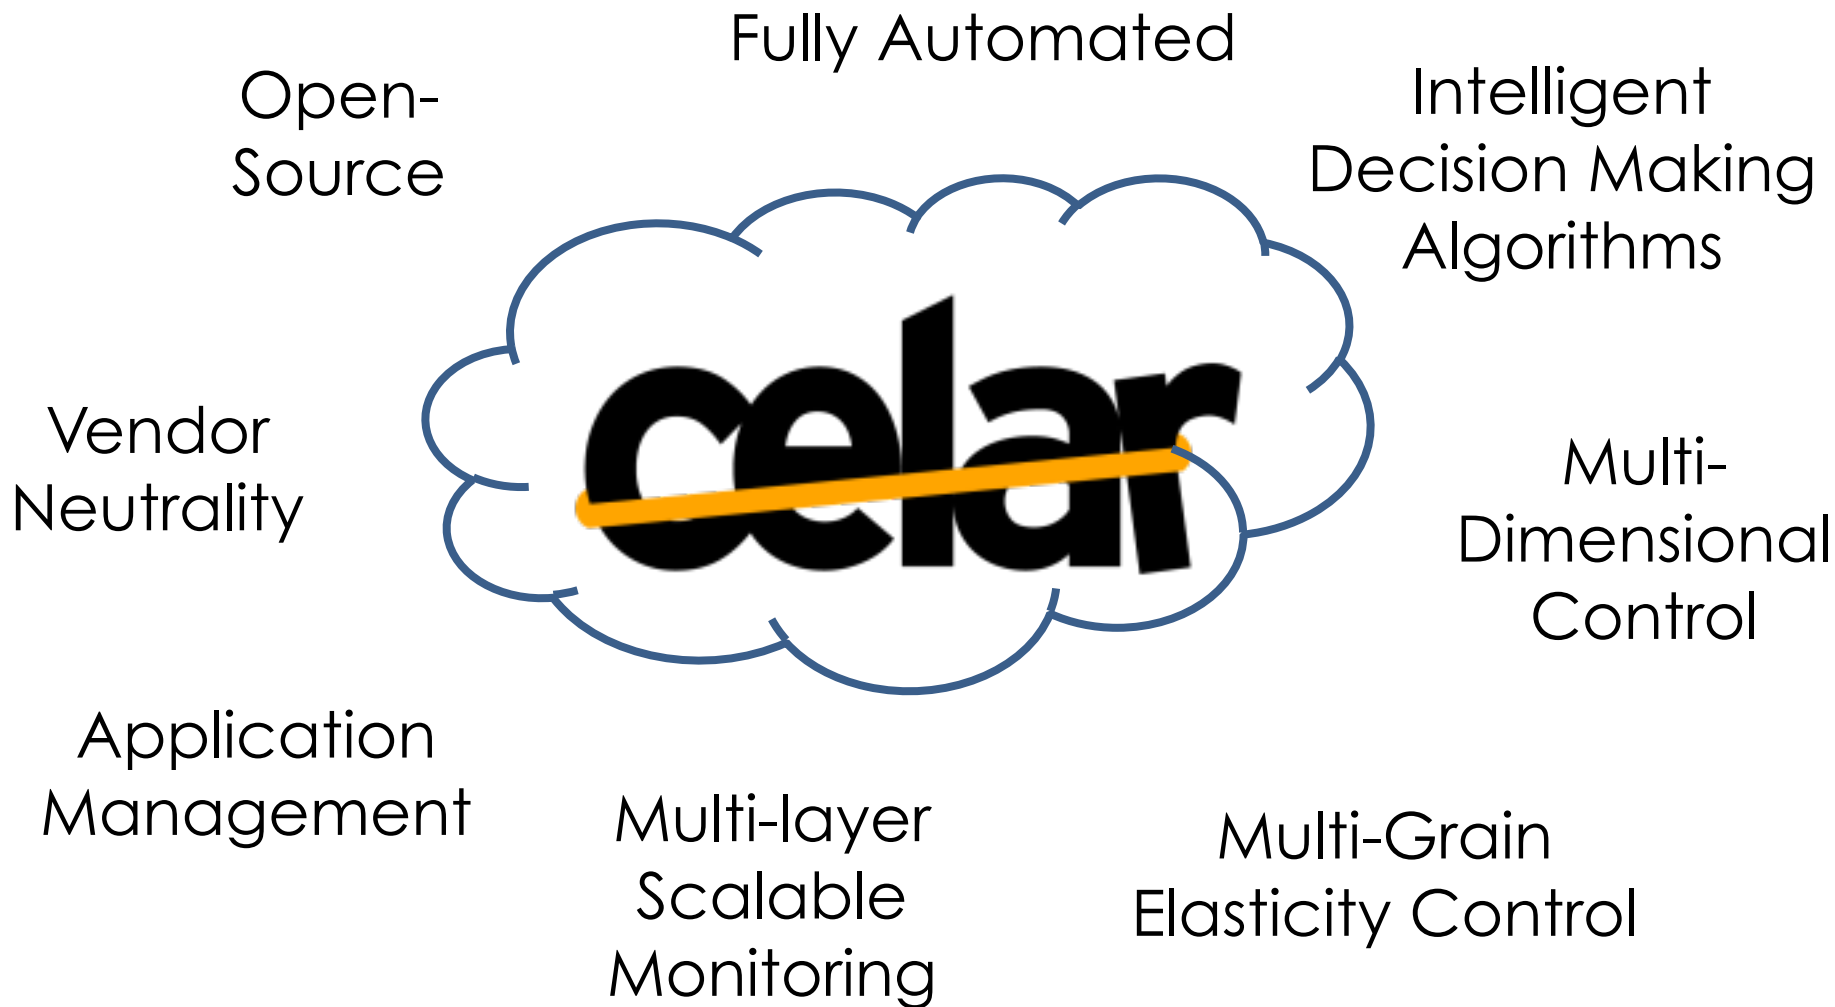

Requirements

- Self-service interface
- Provision system images
- Metering and billing
- Include service catalogs
- Support configuration of resources
- Policy-based workload optimisation
- Application Monitoring
- etc

OUTLINE

- Cloud Computing
- Main topics:
 - Elasticity
 - Application Management
- **CELAR Architecture**
- Elastic Monitoring - JCatascopia

OUTLINE

- Cloud Computing
- CELAR main topics:
 - Elasticity
 - Application Management
- CELAR Architecture
- **Elasticity and Monitoring - JCatascopia**
- c-Eclipse and CAMF
- Conclusions

Elasticity controller

In general, elasticity constraints are too complex for users and based on low-level metrics

Elasticity Control Estimation and Evaluation

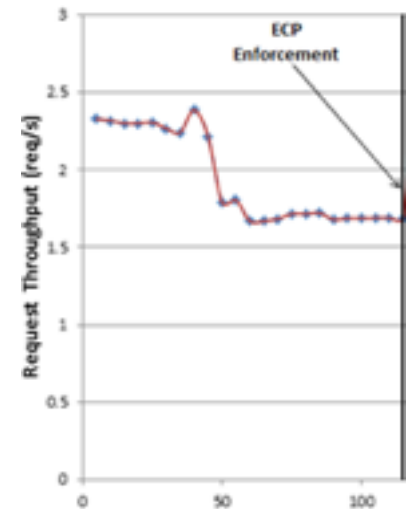

- How should we interpret a sudden drop in request throughput at the business tier of a 3-tier cloud service?

A. There are **less clients**; this makes the business tier inefficiently utilised

- Right Decision: **Remove an Application Server**

B. Video storage **backend under-provisioned**, requests are getting queued at business tier

- Right Decision: **Add another Database Node**

Elasticity Controller with simple IF-THEN-ELSE policies based on metric violations cannot determine the right ECP to improve QoS or cost

Current Elasticity Controllers

- *Manual or semi-automated* elasticity control
- Vendor-specific
- Elasticity modelled as a one-dimensional property
 - No control over **cost**, **performance** and **quality**
- Only “horizontal” elasticity control
 - e.g. add/remove virtual instances

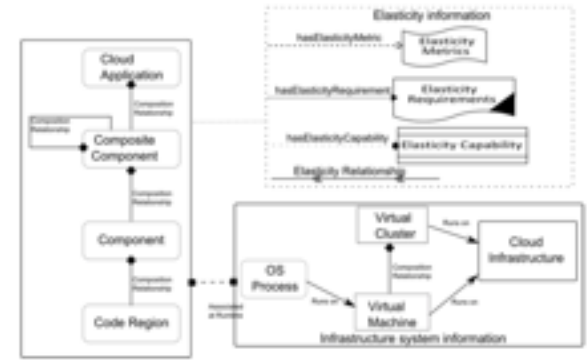

CELAR Elasticity Building Blocks

- Conceptualising and modelling elastic objects and execution environments
- Defining and capturing elasticity primitive operations associated with elastic objects
- Programming elastic objects and actions
- Runtime deployment, control and monitoring techniques for elastic objects

Source: Hong-Linh Truong (TUW), Cloudcom '14

Elasticity in CELAR

Dependency Graph capturing application structure and enabling a multi-level specification of elasticity: Application unit, service topology, application

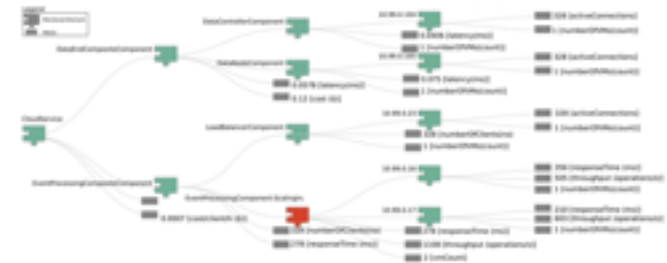

Elasticity requirement specification - SYBL: Monitoring, constraint, strategy

```
#SYBL.CloudServiceLevel
Cons1: CONSTRAINT responseTime < 5 ms
Cons2: CONSTRAINT responseTime < 10 ms
WHEN nbOfUsers > 10000
Str1: STRATEGY CASE fulfilled(Cons1) OR
fulfilled(Cons2): minimize(cost)

#SYBL.ServiceUnitLevel
Str2: STRATEGY CASE ioCost < 3 Euro :
maximize( dataFreshness )

#SYBL.CodeRegionLevel
Cons4: CONSTRAINT dataAccuracy>90%
AND cost<4 Euro
```

Multi-dimensional Modeling & analysing Elasticity of Cloud Services - MELA: Resources, cost, quality

Multi-level elasticity control through rSYBL

Elasticity Policies Specification in SYBL

- *SYBL* language enables elasticity requirements description for Cloud applications
- Elasticity specification at different levels
 - Component, composite component, application
- Two types of SYBL elasticity requirements:
 - **Constraint**: "Constraint 1: CPU_Usage < 80%"
 - **Strategy**: "Strategy 1: CASE Violated (Constraint 1) : Scale_Out"

"SYBL: an Extensible Language for Controlling Elasticity in Cloud Applications", G. Copil, D. Moldovan, H. Truong and S. Dustdar, 13th IEEE/ACM International Symposium on Cluster, Cloud and Grid Computing (CCGrid 2013), 2013

#SYBL.CloudServiceLevel

Cons1: CONSTRAINT responseTime < 5 ms
Cons2: CONSTRAINT responseTime < 10 ms
WHEN nbOfUsers > 10000
Str1: STRATEGY CASE fulfilled(Cons1) OR fulfilled(Cons2): minimize(cost)

#SYBL.ServiceUnitLevel

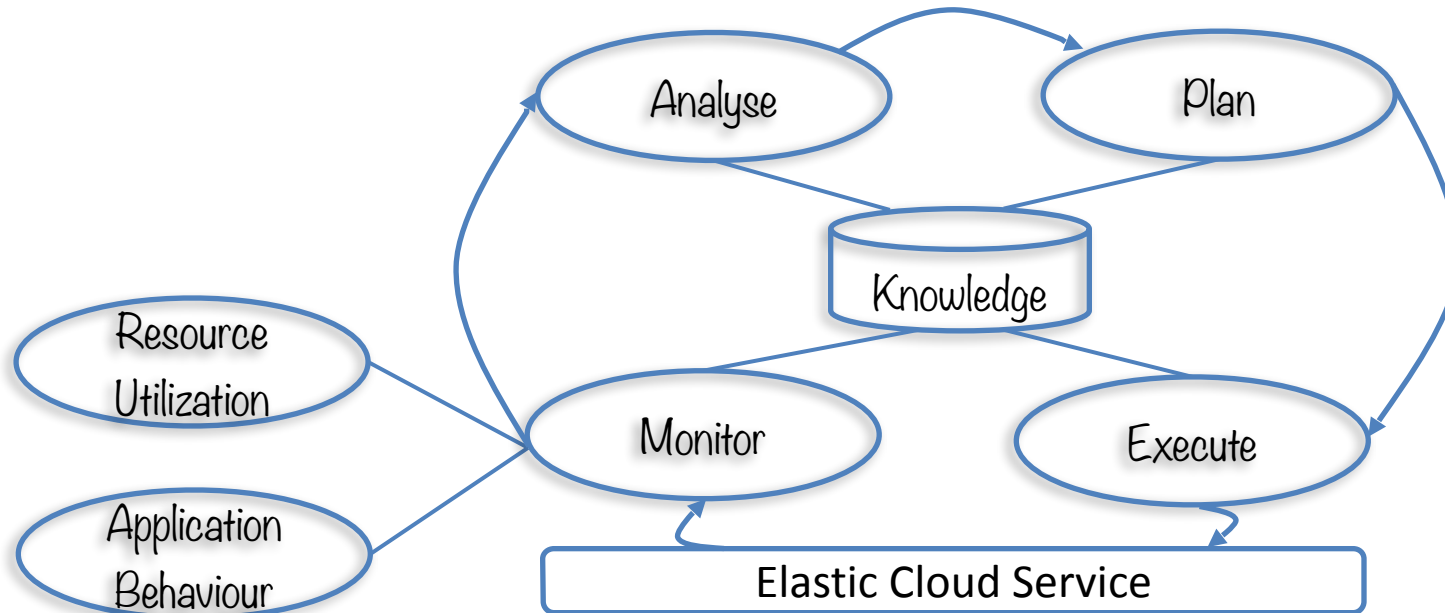

Str2: STRATEGY CASE ioCost < 3 Euro : maximize(dataFreshness)

#SYBL.CodeRegionLevel

Cons4: CONSTRAINT dataAccuracy>90%
AND cost<4 Euro

Monitoring for Elastic Control

- MAPE-K control loop (Monitoring, Analysing, Planning, Executing using Knowledge)

Trihinas, D., Pallis, G., & Dikaiakos, M. D. (2014a) JCatascopia: Monitoring Elastically Adaptive Applications in the Cloud, in *14th IEEE/ACM International Symposium on Cluster, Cloud and Grid Computing, 2014*.

Cloud Monitoring Challenges

- Monitor heterogeneous types of run-time information and resources
- Extract metrics from multiple levels of the cloud
 - Low-level metrics (i.e. CPU usage, network traffic)
 - High-level metrics (i.e. application throughput, latency, availability)
- Metrics collected at different time granularities
- Non-intrusiveness

Cloud Monitoring Challenges

- Cloud Platform Independence
 - If a cloud service is portable then it can be moved to another platform due to better *pricing schemes, availability, QoS, etc.*

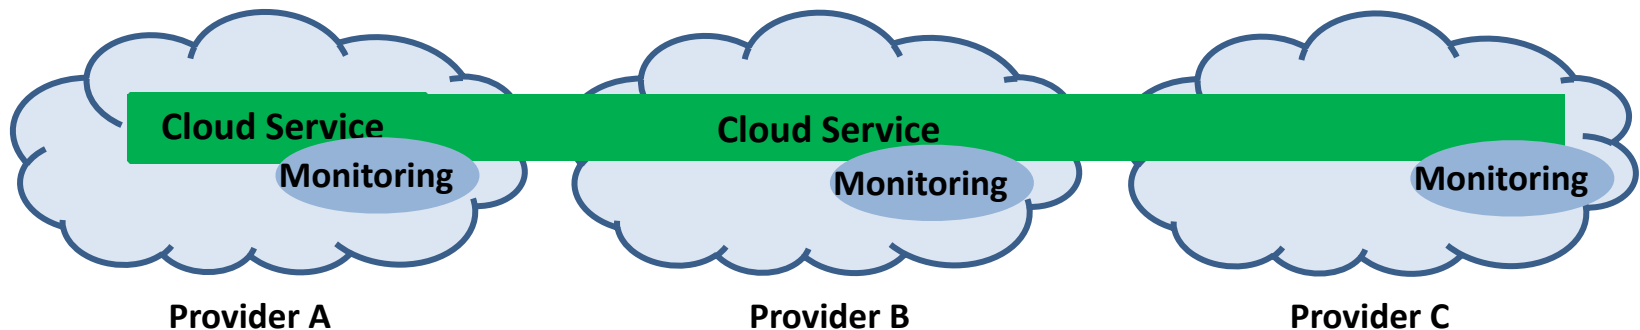

- Monitoring System?
 - Portable
 - Easily configurable on new platform

Cloud Monitoring Challenges

- Interoperability

- Distribute a cloud service across multiple providers due to better resource locality, availability or security concerns

42% are interested in adopting **hybrid cloud**. Estimated to rise to **55% by 2016** [GIGAOM 2014]

- Monitoring System?

- Operate and collect metrics seamlessly across multiple providers

Cloud Monitoring Challenges

- Elasticity Support
 - Detect configuration changes in a cloud service
- Monitoring System?
 - Detect configuration changes automatically without restarting monitoring process or part of it and without any human intervention

Application topology changes
(e.g. new VM added)

Allocated resource changes
(e.g. new disk attached to VM)

Cloud Monitoring State-of-the-art

- Cloud-specific Monitoring Tools

- Limited to a specific number of cloud platforms
- **Commercial** and **proprietary** -> limited portability and interoperability

- General Purpose Monitoring Tools

- Suitable for only slowly changing fixed infrastructures
- Limited application-level monitoring support

- **No elasticity support**

- Detect configuration changes in:
 - Application topology (e.g. new VM added)
 - Allocated resource (e.g. new disk attached to VM)

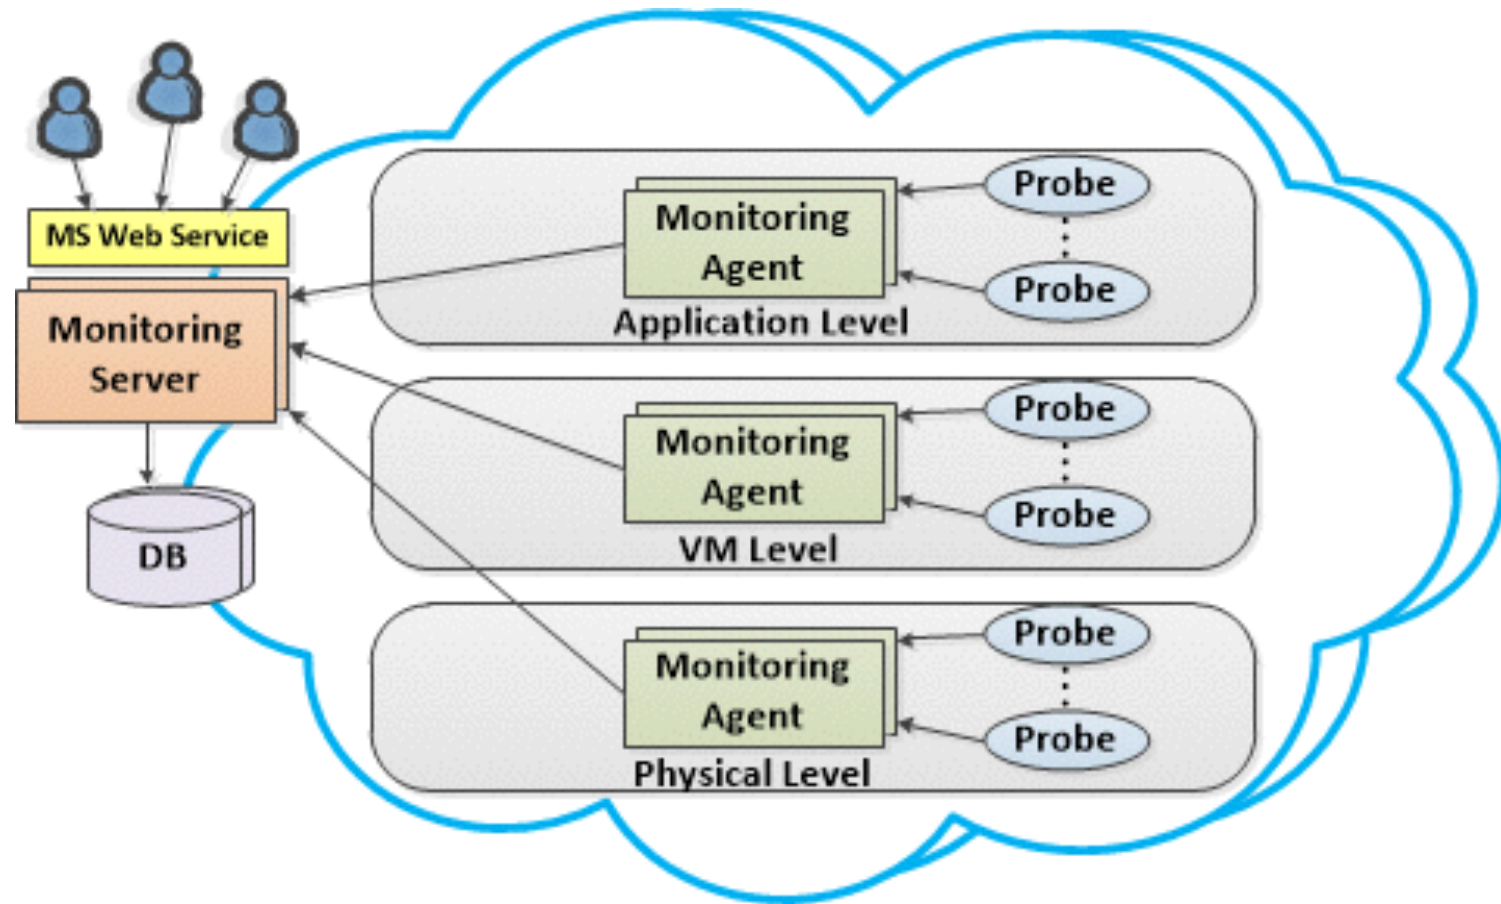

JCatascopeia Monitoring System

- Open-source
- Interoperable
- Scalable
- Multi-Layer Cloud Monitoring
 - Customisable and Extensible by Users
 - *Metric Subscription Rule Language*
- Platform Independent
 - Operates on any cloud platform
 - Metric collection, distribution or storage are *independent* to underlying infrastructure
- Elastic by design

“JCatascopeia: Monitoring Elastically Adaptive Applications in the Cloud”, Trihinas, Pallis, & Dikaiakos, *CCGrid2014*.

JCatascopia Architecture

Monitoring Probes

- The actual metric collectors managed by Monitoring Agents
- Collect system-level and application performance metrics
- Push or Pull mechanism to forward metrics to their corresponding Agent

JCatascopia Probes

- JCatascopia Probe API
- Application developers can implement their own Probes
- Dynamically deployable to Monitoring Agents
- Push and Pull metric delivery mechanism
- Filtering mechanism at Probe level
 - Minimizes communication and storage overhead
 - Probe developers can create their own metric filters

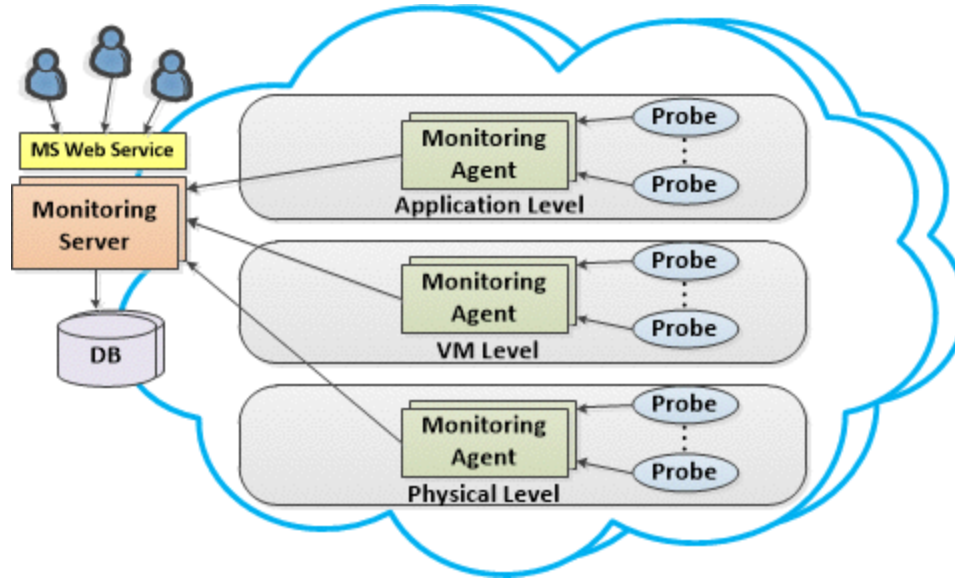

Monitoring Agents

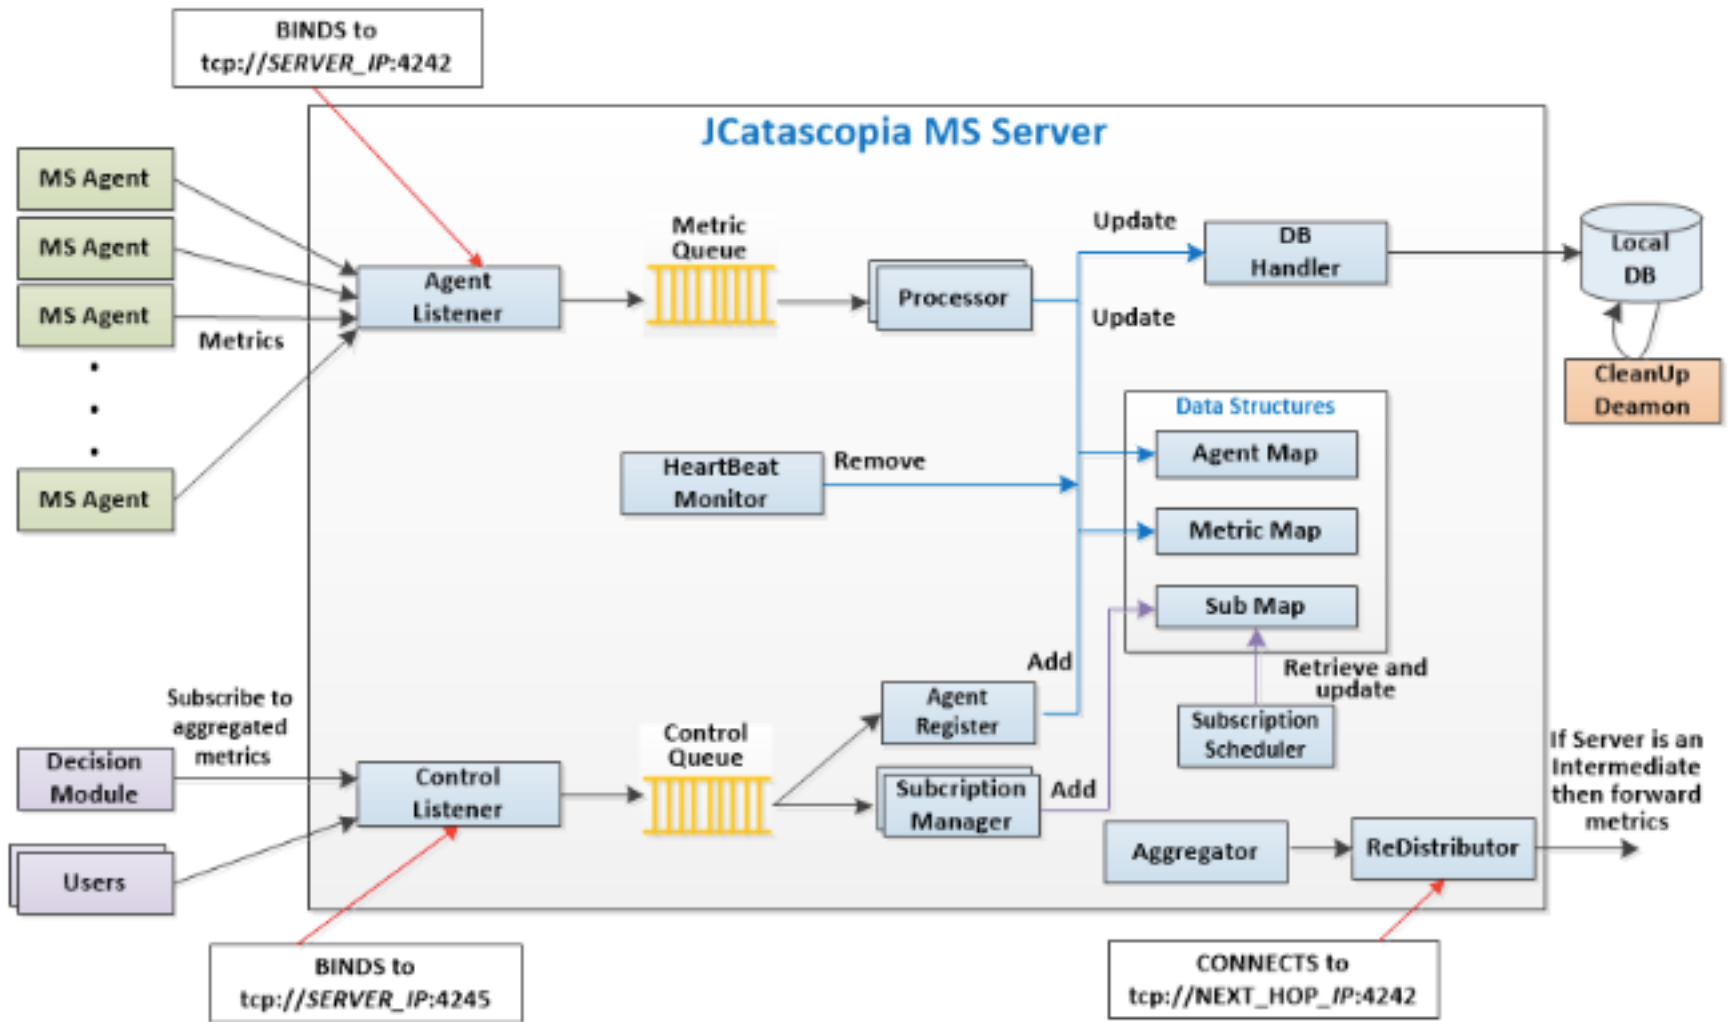

- Light-weight monitoring instances
- Deployable on physical nodes or virtual instances

- Responsible for the metric collection process
- Aggregate and distribute collected metrics (pub/sub)

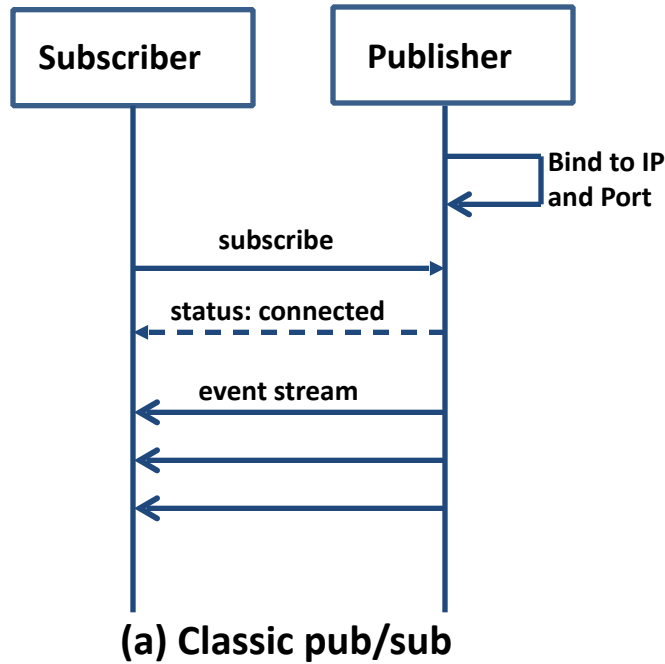

Monitoring Server

- Receives metrics from Monitoring Agents
- Aggregates, filters, processes and stores metrics in Database
- Handles user metric and configuration requests
- Hierarchy of Monitoring Servers for greater scalability

Dynamic Agent Discovery

Benefits

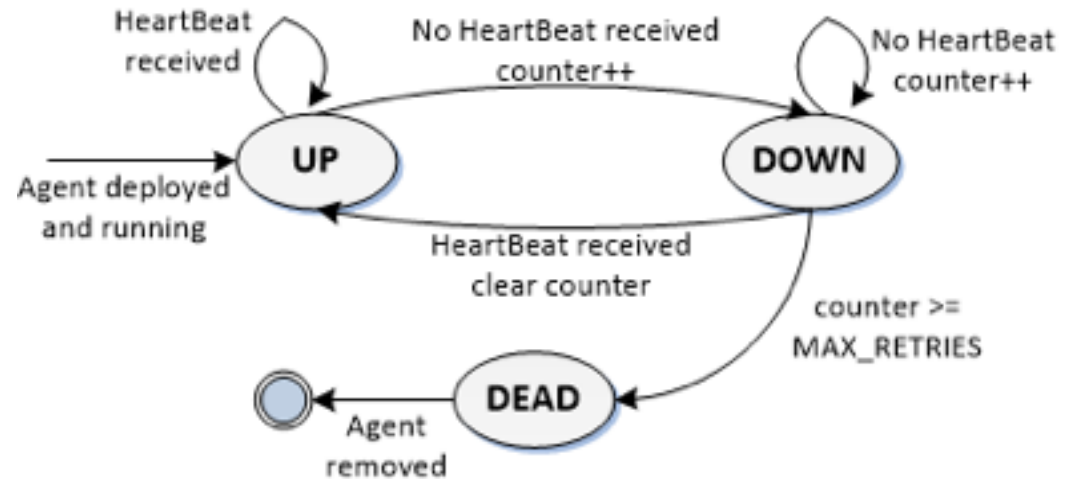

- Monitoring Servers are agnostic of Agent network location
- Agents appear dynamically

Eliminated the need to

- Restart or reconfigure Monitoring System
- Depend on underlying hypervisor
- Require directory service with Agent locations

Dynamic Agent Removal

- **Heartbeat monitoring** to detect when Agents:
 - Removed due to scaling down elasticity actions
 - Temporary unavailable (network connectivity issues)

Metric Subscription Rule Language

- Aggregate single instance metrics

```
SUM(errorCount)
```

- Generate high-level metrics at runtime

```
DBthroughput =  
    AVG(readps+writeps)
```

```
<SubscriptionRule> ::= <Filter>, <Members>, <Action>  
  
<Filter> ::= <MetricName> = <Expression> | <GroupFunction>(<Expression>)  
<Expression> ::= <Operand> | <Operand> <Op> <Expression>  
<Operand> ::= <Number> | <MetricName> | (<Expression>)  
<Op> ::= +|-|*|/  
<MetricName> ::= <String>  
<GroupFunction> ::= AVG|SUM|MIN|MAX  
  
<Members> ::= MEMBERS = ({<AgentID>,) <AgentID>)  
<AgentID> ::= <String>  
  
<Action> ::= ACTION = NOTIFY(<Act>) | PERIOD(<Number>)  
<Act> ::= ALL | [<Relation> <Number>,) <Relation> <Number>  
<Relation> ::= <|>|=|!|=|>|=|<=
```

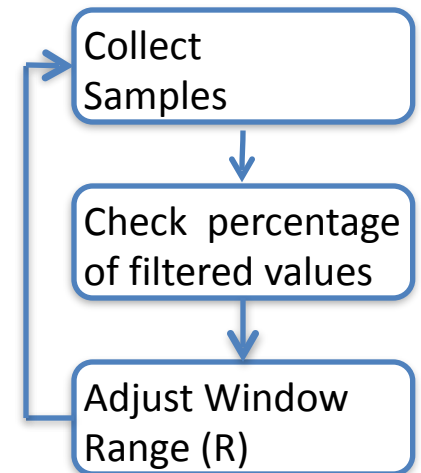

Subscription Rule Example

Average DBthroughput from the low-level metrics readps and writeps of a database cluster comprised of N nodes:

```
DBthroughput = AVG(readps + writeps)  
MEMBERS = [id1, ... ,idN]  
ACTION = NOTIFY(<25,>75%)
```

Adaptive Filtering

- Simple fixed range filter windows are not effective:
 - i.e. filter currentValue if in window $\text{previousValue} \pm R$
 - No guarantee that any values will be filtered at all
- Adaptive filter window range
 - Window range (R) is not static but depends on percentage of values previously filtered

Evaluation

- Validate JCatascopia functionality and performance
- Compare JCatascopia to other Monitoring Tools
 - Ganglia
 - Lattice Monitoring Framework
- Testbed
 - Different domains of Cloud applications
 - Various VM flavors
 - 3 public Cloud providers and 1 private Cloud

Testbed

<i>Cloud Provider</i>	<i>VM no.</i>	<i>VM Flavor</i>	<i>Applications</i>
<i>GRNET Okeanos public Cloud1</i>	<i>15</i>	<i>1GB RAM, 10GB Disk, Ubuntu Server 12.04 LTS</i>	<i>12 VMs Cassandra⁷ 3 VMs YCSB Clients⁸</i>
<i>Flexiant FlexiScale platform2</i>	<i>10</i>	<i>2 VCPU, 2GB RAM, 10GB Disk, Debian 6.07 (Squeeze)</i>	<i>HASCOP⁹</i>

<i>Disk Usage</i>	<i>diskTotal, diskFree, diskUsed</i>	<i>60</i>
<i>Disk IO</i>	<i>readkbps, writekbps, iotime</i>	<i>40</i>
<i>Cassandra</i>	<i>readLatency, writeLatency</i>	<i>20</i>
<i>YCSB</i>	<i>clientThroughput, clientLatency</i>	<i>10</i>
<i>HASCOP</i>	<i>clustersPerIter, iterElapTime, centroidUpdTime, pTableUpdTime, graphUpdTime</i>	<i>20</i>

Monitoring Agent Runtime Footprint

YCSB Agent Client (11 metrics)

Cassandra Agent Utilization (27 metrics)

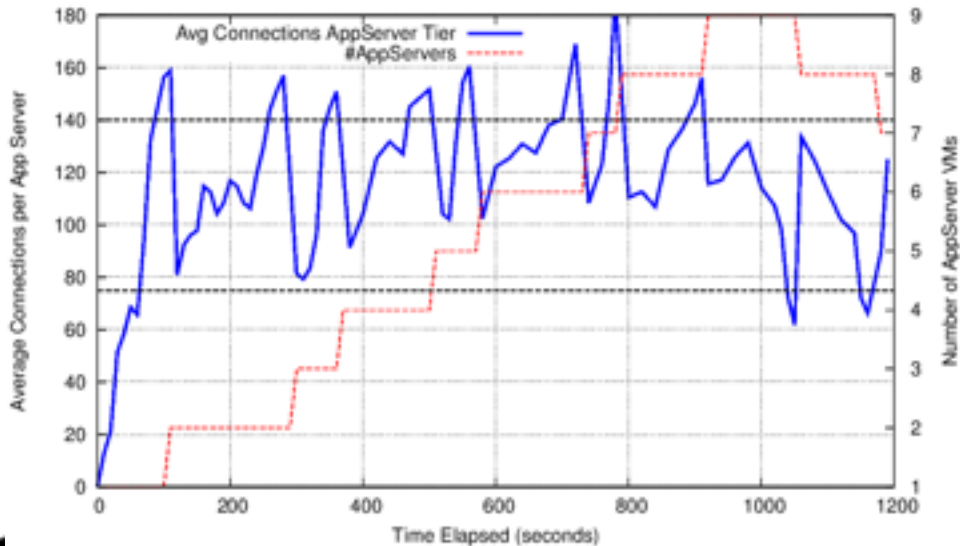

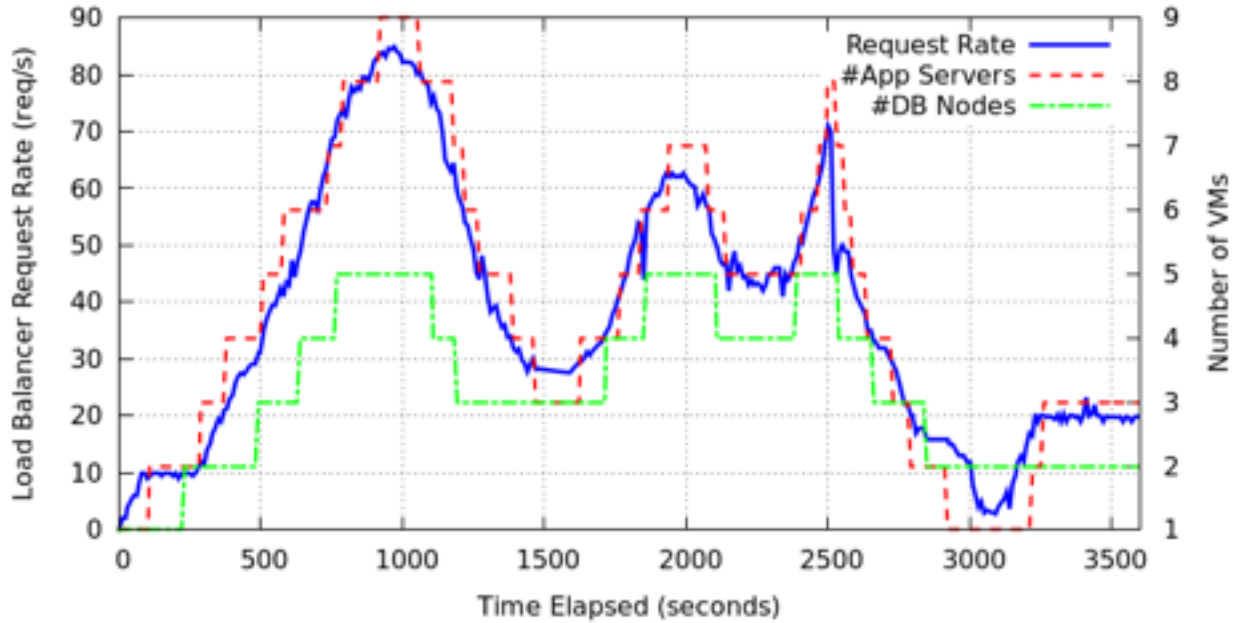

HASCOP (Distributed Clustering Algorithm) Agent (39 metrics)

More Application-Specific Metrics

When in need of **application-level monitoring**, for a small runtime overhead, **JCatascopia** can **reduce** monitoring network traffic and consequently **monitoring cost**

Multi-Tier Monitoring

JCatasopia Metric Rule Language and Mechanism

```
avgActiveConnections = AVG(busyThreads)
MEMBERS = [id1, ... ,idN]
ACTION = NOTIFY(<70, >=140)
```

```
avgCPUUsage = AVG(1-cpuIdle)
MEMBERS = [id1, ... ,idN]
ACTION = NOTIFY(<30, >=85)
```

When archiving time is high, we can direct monitoring metric traffic through multiple Monitoring Servers, allowing the monitoring system to scale

JCatascope Release

- Open-source under **Apache 2.0 Licence**
 - **Github:** <https://github.com/CELAR/cloud-ms>
- JCatascope Website (docs, examples, videos, publications, etc.)
 - <http://linc.ucy.ac.cy/CELAR/jcatascope>
- Packaging (**JARs, tarballs, RPMs and Chef recipes**) available in CELAR repo
- JCatascope **Probe Library** and Java Probe API
 - <https://github.com/dtrihinas/JCatascope-Probe-Library>
 - System-level monitoring probes (for both Linux and Windows)
 - Application-specific probes (Tomcat, Cassandra DB, HAProxy, PostgreSQL DB, RabbitMQ)
- Supporting **2 Different Database Backends** (MySQL, Cassandra DB)

OUTLINE

- Cloud Computing
- CELAR main topics:
 - Elasticity
 - Application Management
- CELAR Architecture
- Elasticity and Monitoring - JCatascopia
- **c-Eclipse and CAMF**
- Conclusions

Cloud Application Management

- Goal: ease the description & deployment of applications over Cloud infrastructures.
- However:
 - Most frameworks are vendor-specific and fail to address one of the main challenges in cloud application management, that is the **vendor neutrality** [Gartner]
 - Proprietary
 - Provide limited support for elasticity

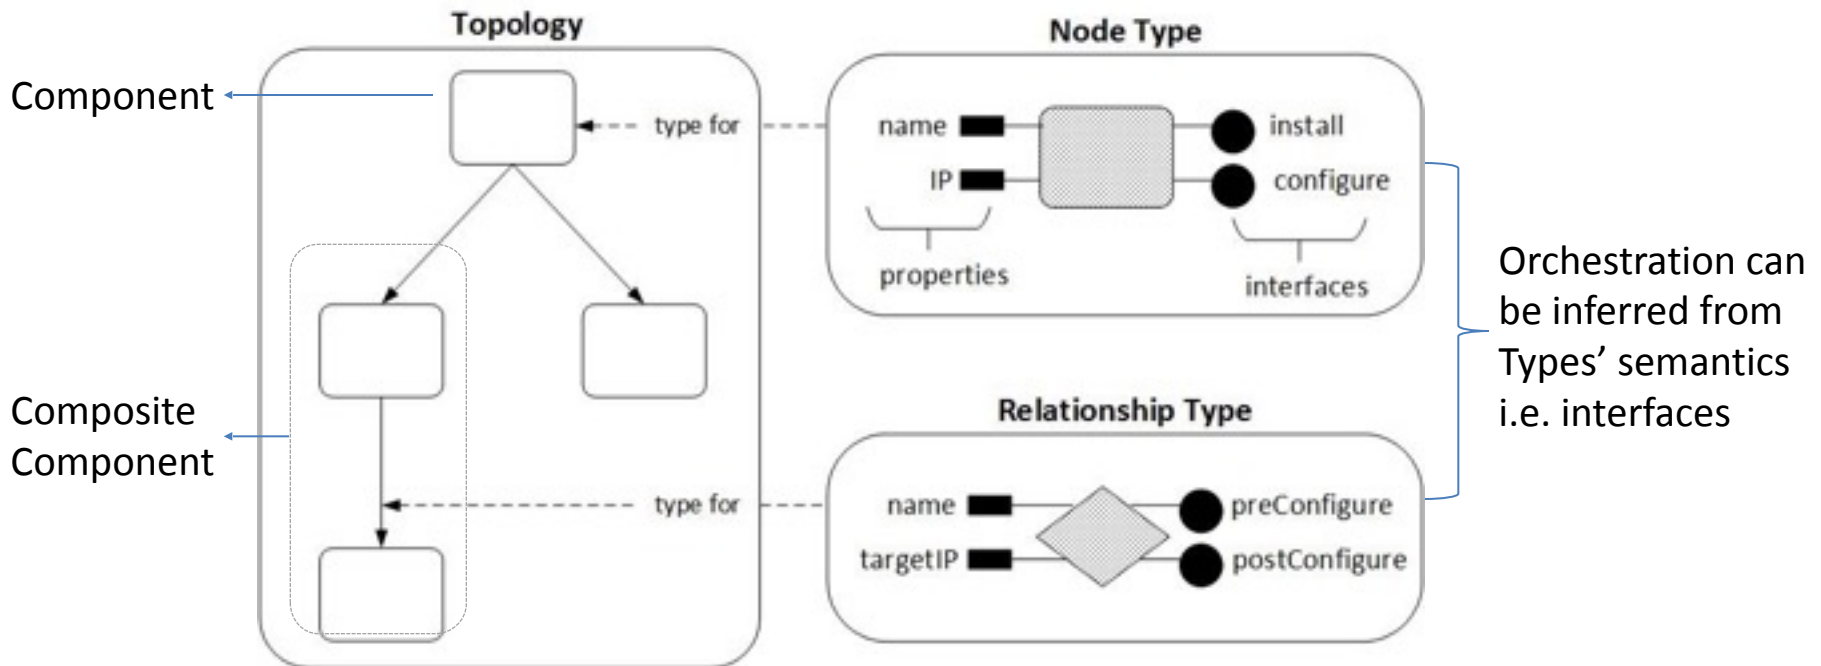

c-Eclipse

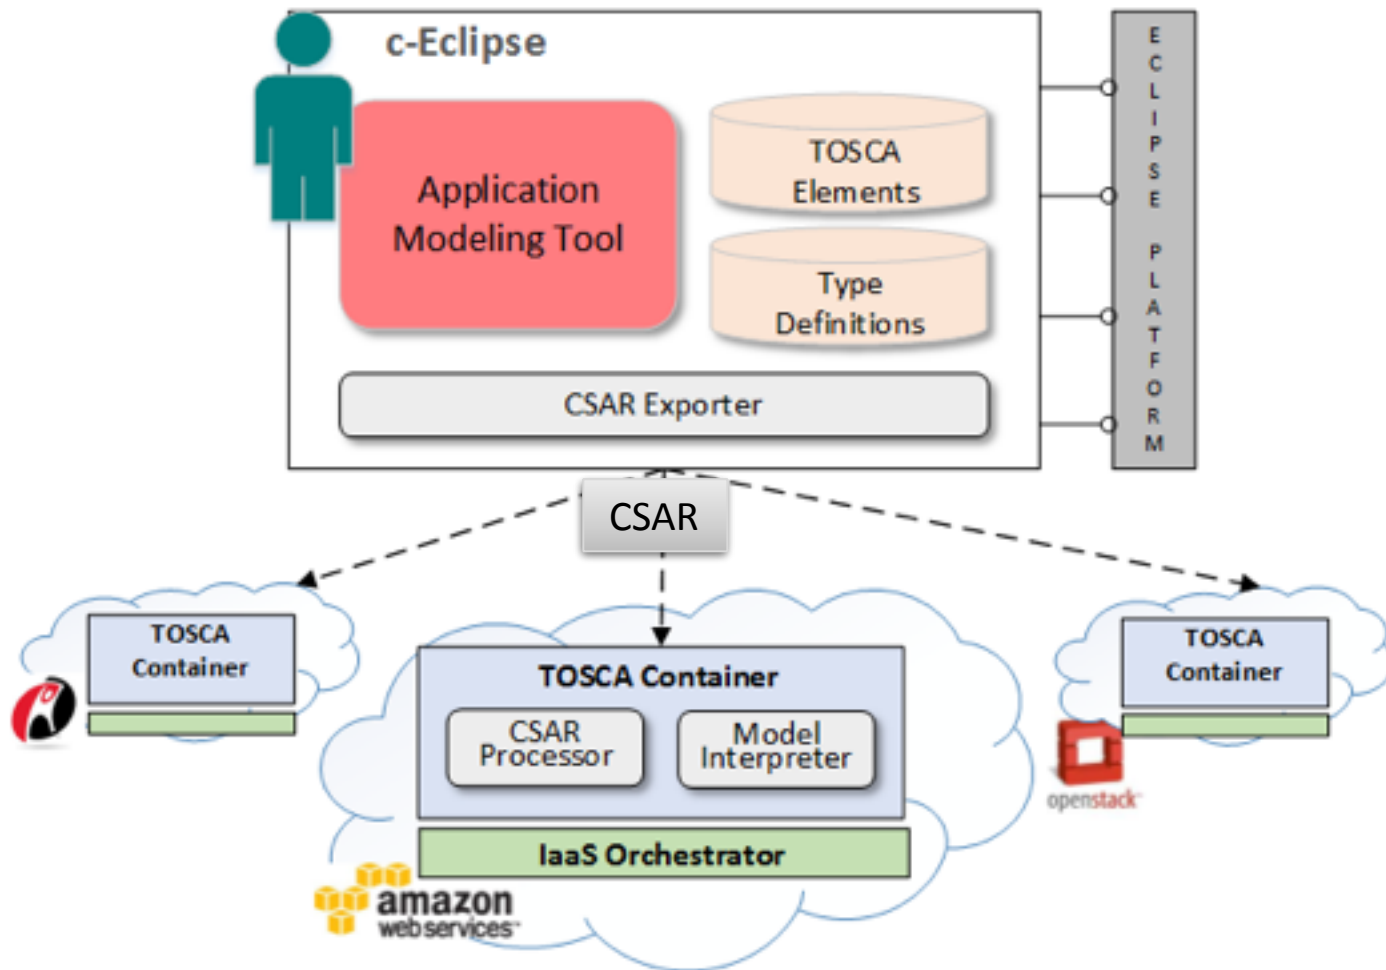

- Open-source (on top of Eclipse platform)
- Manages Complete Cloud Application Life Cycle
- Platform independent
- Intuitive graphical drag-and-drop UI
- Adopts open Cloud specifications
- Separates general-purpose functionality from IaaS platform-specific details (portable/extensible)
- Supports an open language for describing Cloud applications' elasticity requirements

- TOSCA provides a language to describe:
 - Application components & relationships ([topology](#))
 - Application management procedures ([orchestration](#))

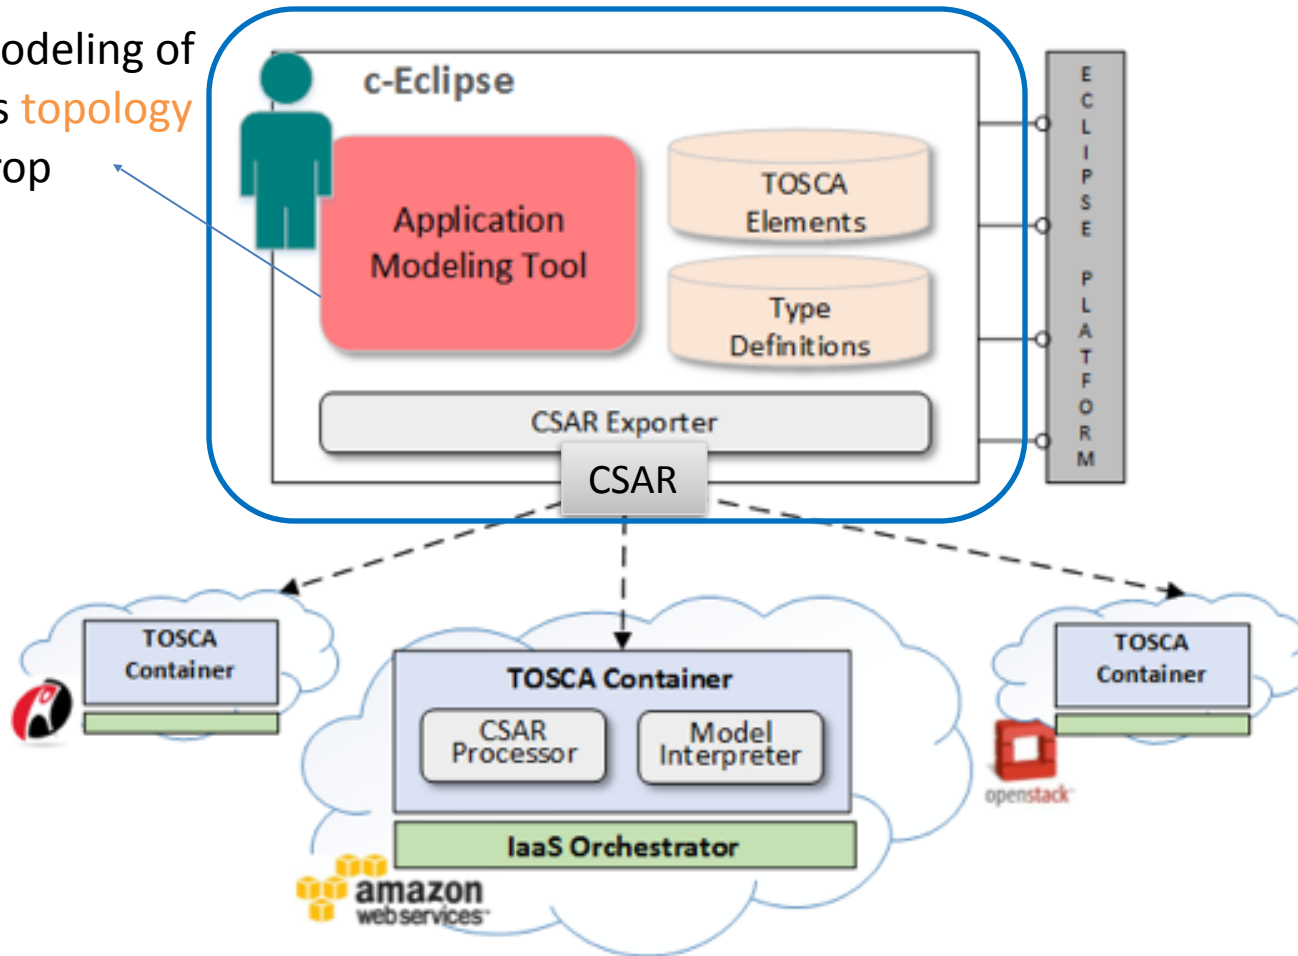

c-Eclipse Architecture

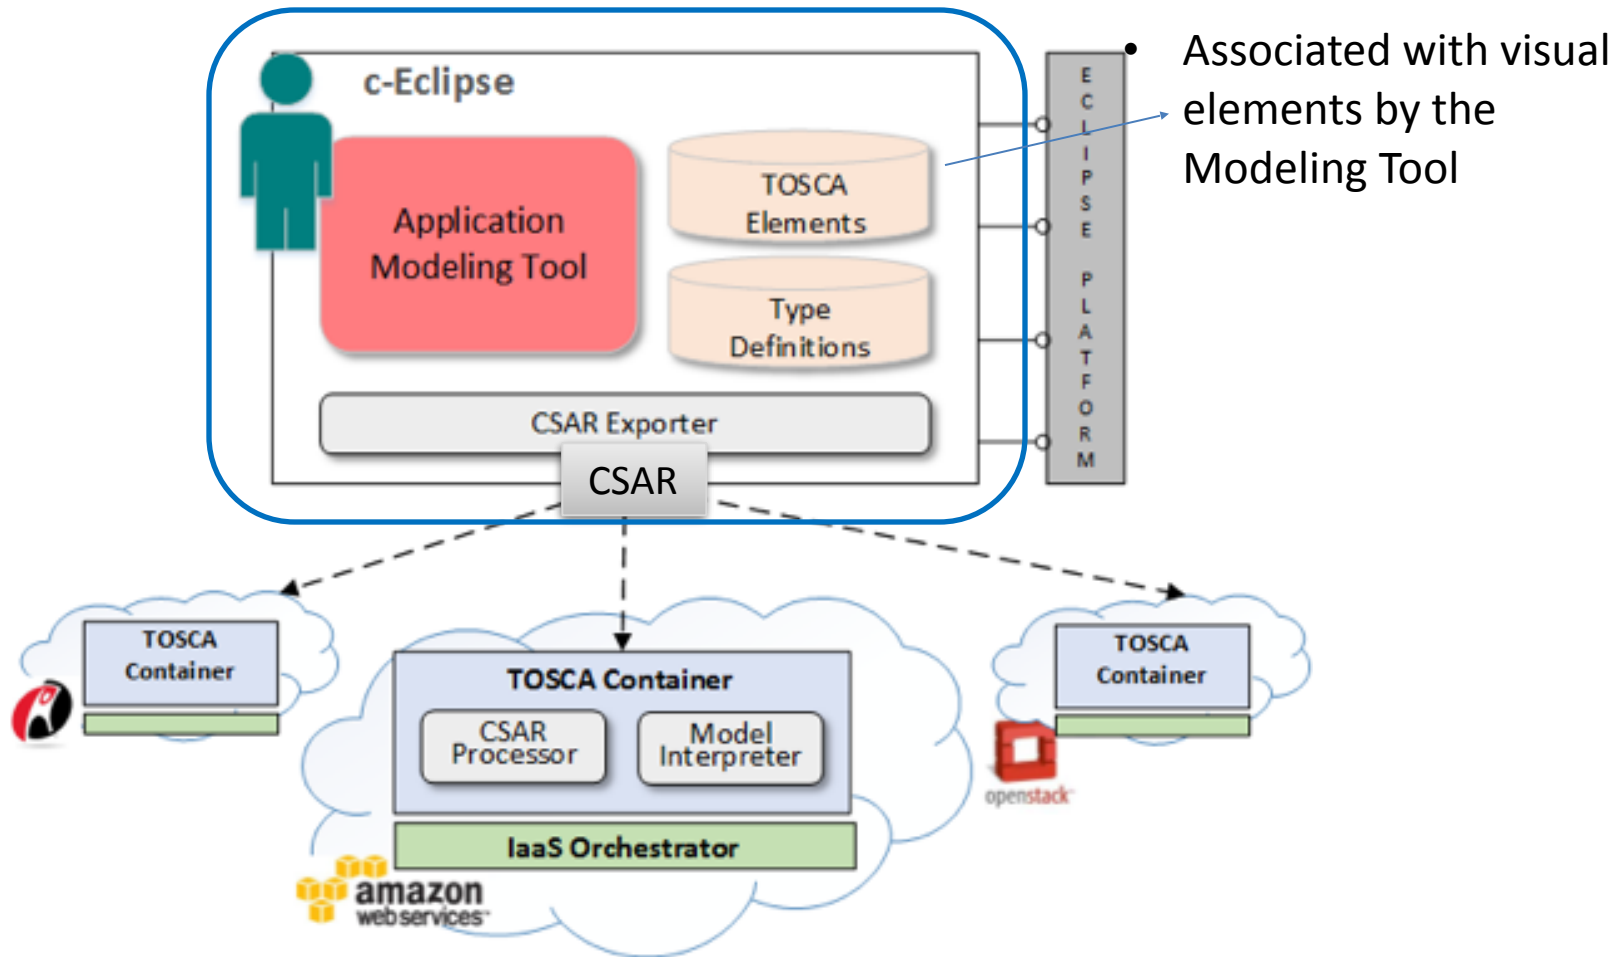

"c-Eclipse: An Open-Source Management Framework for Cloud Applications" C. Sofokleous, N. Loulloudes, D. Trihinas, G. Pallis and M. Dikaiakos, *EuroPar 2014*

c-Eclipse Architecture

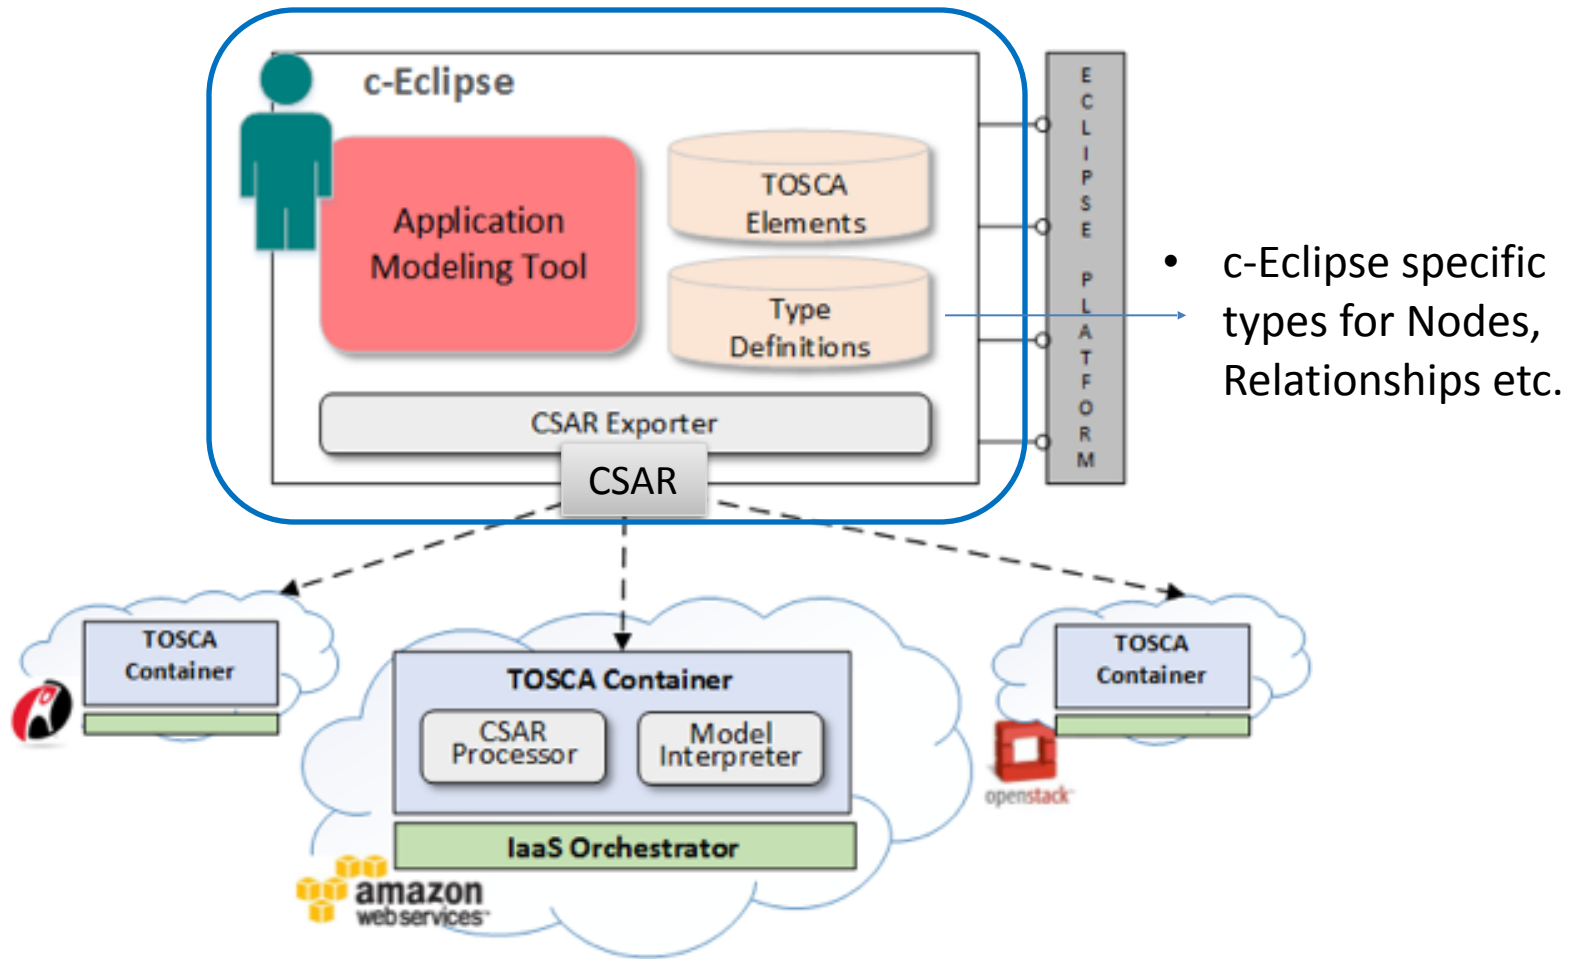

- Graphical modeling of application's **topology**
- Drag-and-drop interface

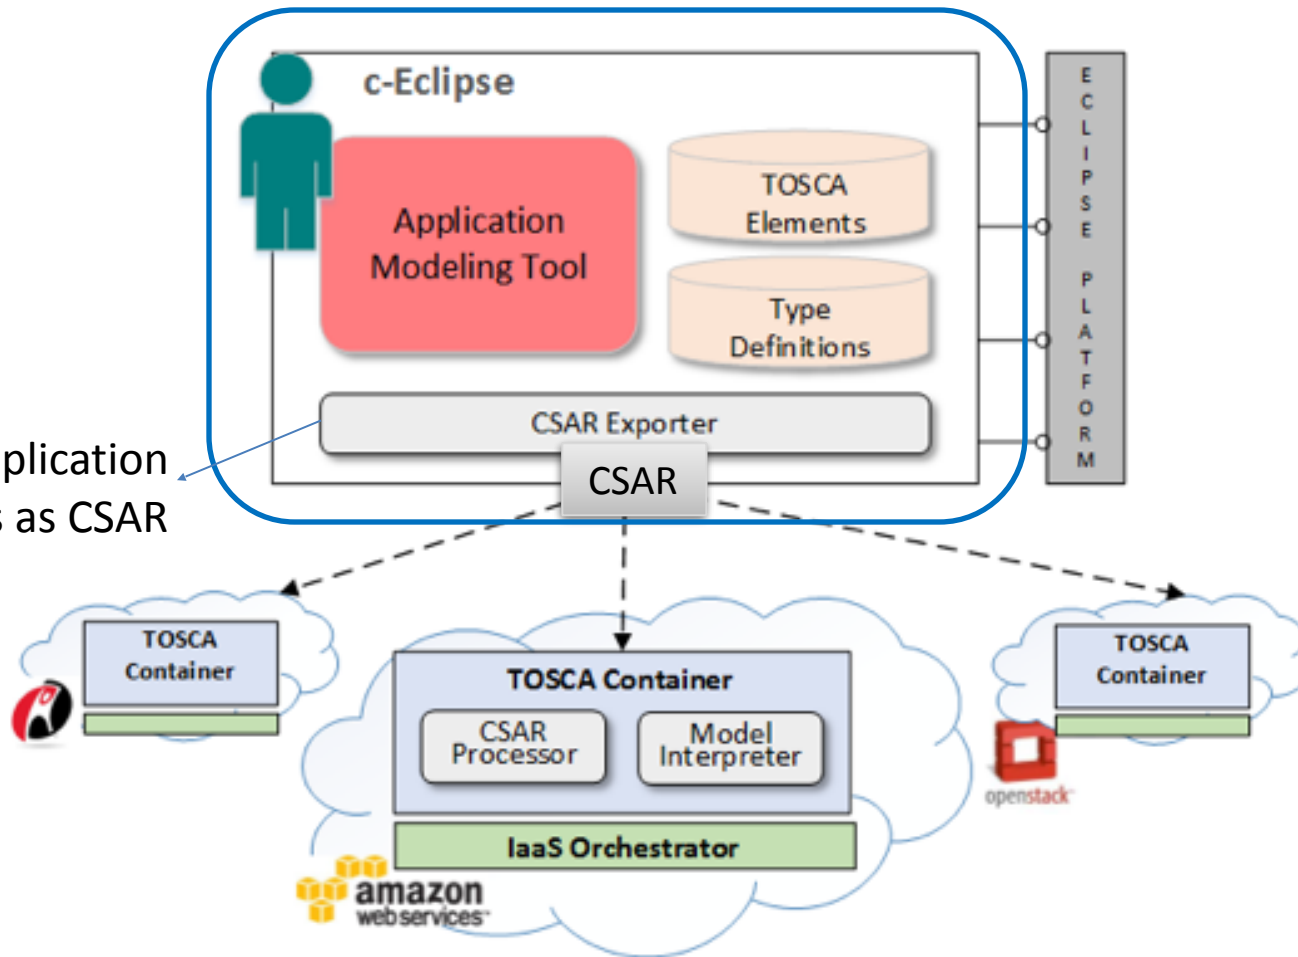

c-Eclipse Architecture

c-Eclipse Architecture

c-Eclipse Architecture

- Packages application descriptions as CSAR archives

Application Modeling Tool

The screenshot displays the Application Modeling Tool interface. On the left, the **Cloud Project View** shows a tree structure of project elements including VideoStream, Application Descriptions, Application Submissions, Artifacts, Applications, and Monitoring. The main **Canvas** area shows a diagram of three application components: **Load_Balancer** (containing `HaProxy.tar` and `haproxy_config.sh`), **Application_Server** (containing `VideoService.war` and `tomcat_config.sh`), and **NoSQL_Database** (containing `cassandra_config.sh`). An arrow points from the Application_Server to the NoSQL_Database. On the right, the **Palette** lists various components and scripts available for modeling. At the bottom, the **Properties View** shows the configuration for the selected **Application_Server** component, including fields for Name, VM Image, VM Description, and Number of Instances (Initial, Min, Max).

Cloud Project View

Canvas

Palette

Properties View

Graphical TOSCA Modeling

The screenshot displays a graphical TOSCA modeling tool interface. The main workspace shows a diagram titled "VideoGenericDescription" containing three application components:

- Load_Balancer**: Contains artifacts `HaProxy.tar` and `haproxy_config.sh`. It is associated with the key pair `id_rsa.pub` and runs on `CentOS_6.4`.
- Application_Server**: Contains artifacts `VideoService.war` and `tomcat_config.sh`. It is associated with the key pair `id_rsa.pub` and runs on `Ubuntu_12.04.2_LTS`.
- NoSQL_Database**: Contains the artifact `cassandra_config.sh`. It is associated with the key pair `id_rsa.pub` and runs on `Ubuntu_12.04.2_LTS`.

An arrow indicates a dependency from the `Application_Server` component to the `NoSQL_Database` component.

The right-hand side features a **Palette** with various tool options and a list of components and artifacts:

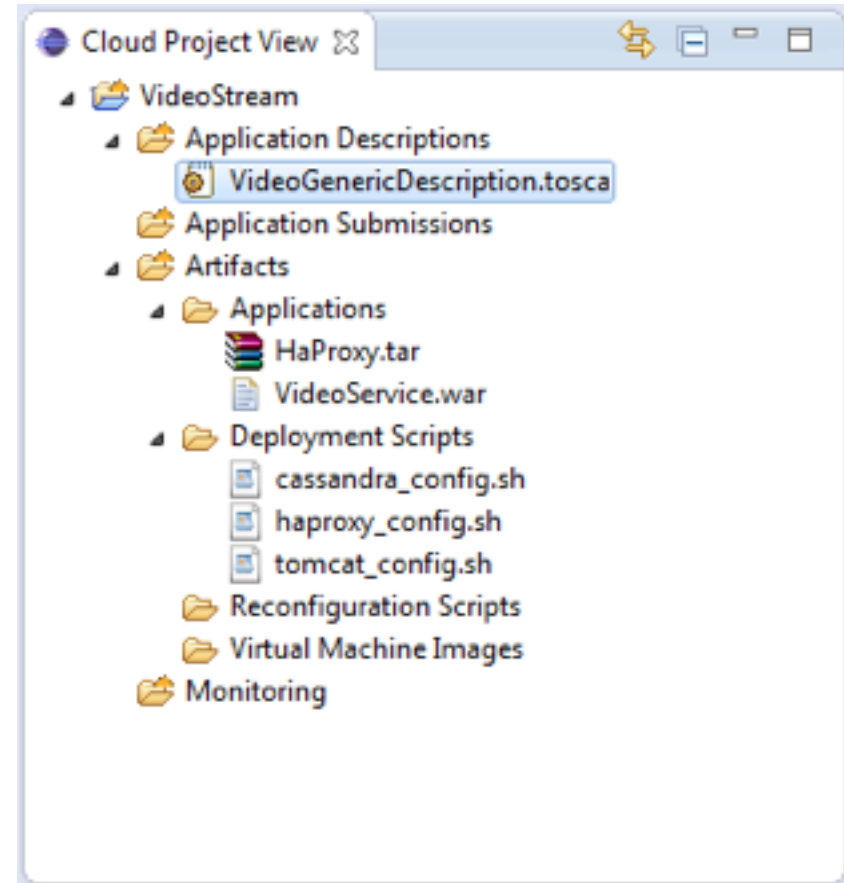

- Application Components**: ApplicationServer, DatabaseServer, LoadBalancer, Composite Component.
- Images**: Monitor Probes, Elasticity Actions, User Applications.
- Key Pairs**: `id_rsa.pub`.
- Deployment Scripts**: `cassandra_config.sh`, `haproxy_config.sh`, `tomcat_config.sh`.

The bottom of the interface includes a **Properties** panel with tabs for **Application Component Elasticity Constraints** and **Elasticity Strategies**.

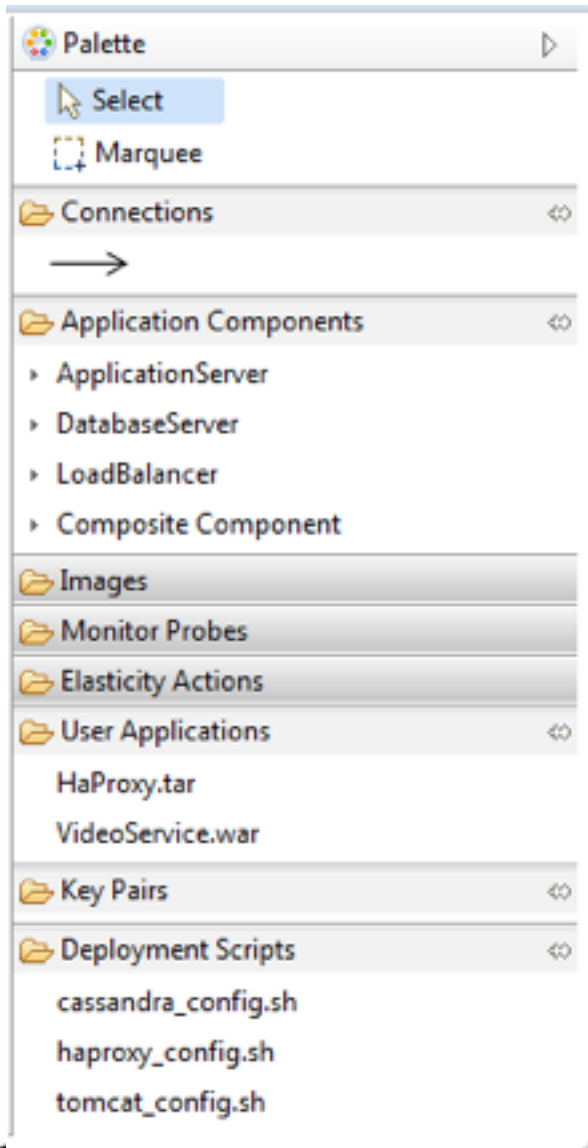

- Application Component Elasticity Constraints**: A table with a "Constraint" column and "Add" and "Remove" buttons.
- Elasticity Strategies**: A table with a "Strategy" column containing the entry "STRATEGY Maximize (ResponseTime)", and "Add", "Remove", and "Condition" buttons.

Cloud Project View

- c-Eclipse organizes files in a structured hierarchy
 - Just like any other Eclipse project
- Folders are placeholders for files required throughout application's lifecycle i.e.
 - Content needed to realize a deployment (executables, configuration files, VM images etc.)
- Folders' structure is automatically created on project's creation

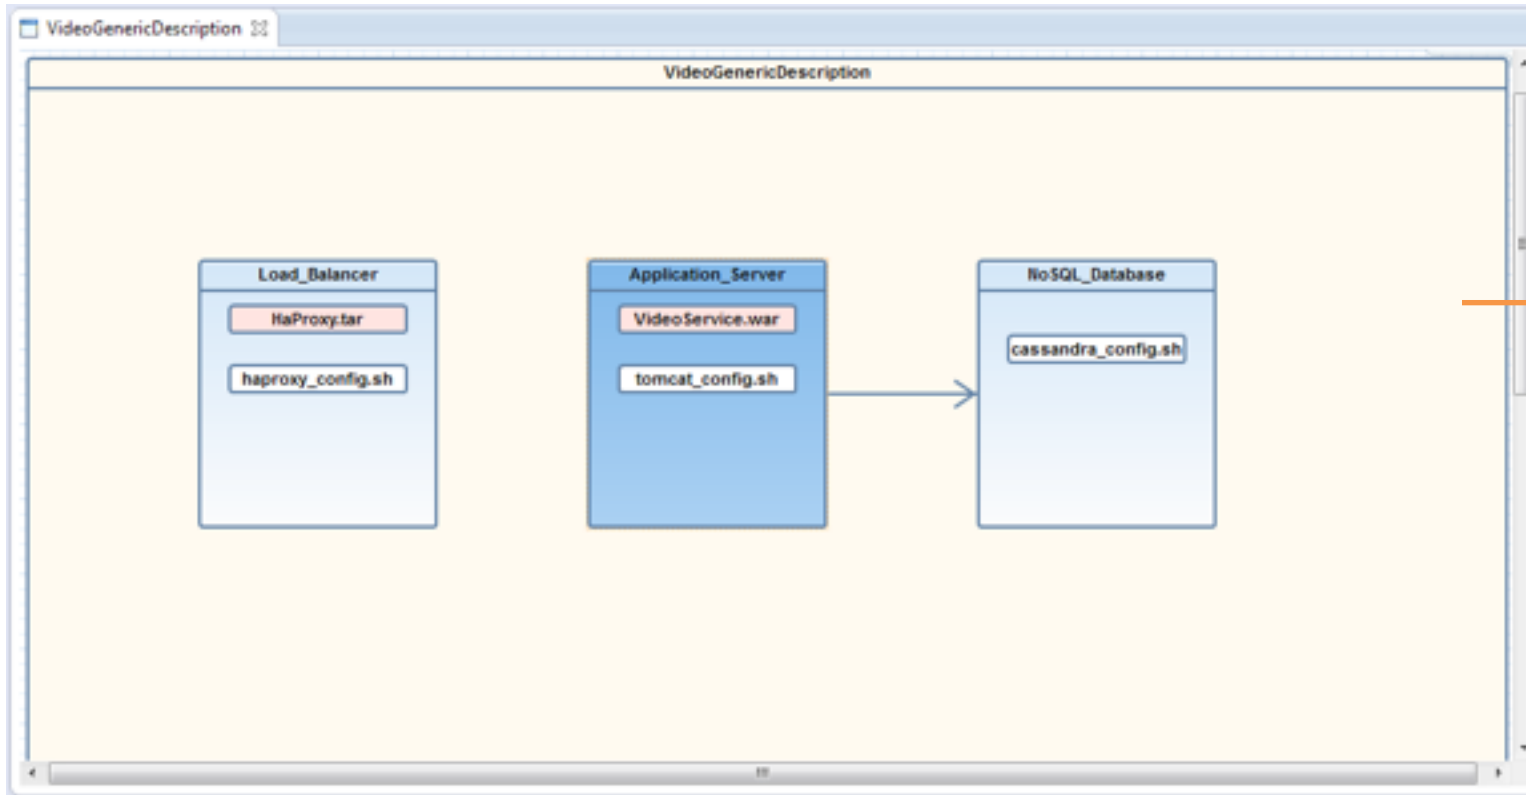

Palette

- **Connections:** Different relationship types can be specified i.e. “Depends On”, “Connects To”
- **Application Components:** Application component types + composite component
- **Images:** Provider’s images & user’s custom built images
- **Monitoring Probes:** Monitoring metrics available by the provider’s monitoring system or by the integrated to c-Eclipse monitoring system
- **Elasticity Actions:** Provider supported elasticity actions & user’s custom elasticity actions
- **User Applications:** User’s custom created applications
- **Key Pairs:** Generated by the user, used for accessing the deployed components
- **Deployment Scripts:** User’s custom configuration scripts

Canvas / Properties View

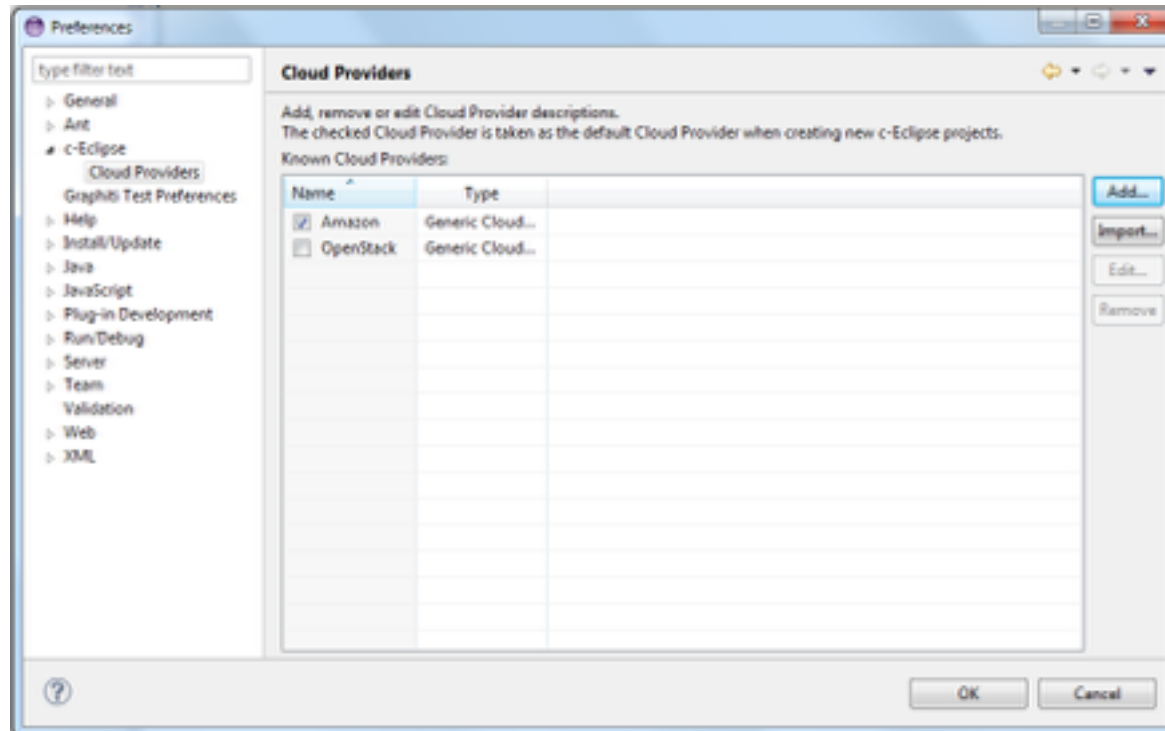

Palette elements can be dragged-and-dropped onto the canvas

Application Component Properties		Number of Instances
Name:	<input type="text" value="Application_Server"/>	Initial: <input type="text" value="1"/>
VM Image:	<input type="text"/> <input type="button" value="Add Image..."/>	Min: <input type="text" value="1"/>
VM Description:	<input type="text"/>	Max: <input type="text" value="3"/>

More details can be specified through the Properties View

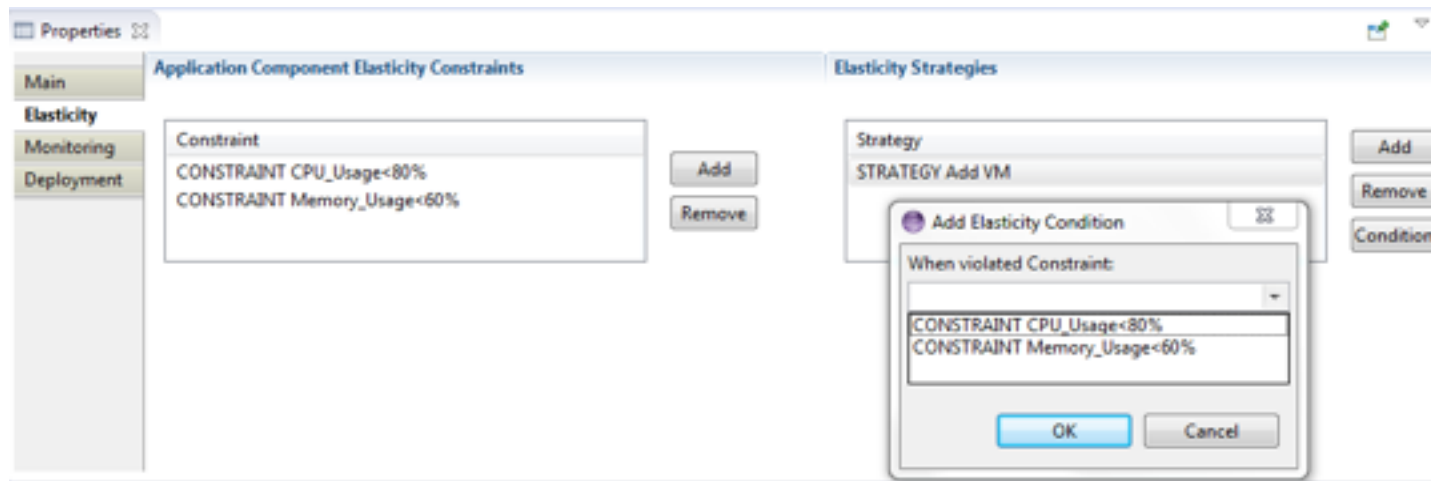

Cloud Provider Selection

- Users can select Cloud providers for deploying their applications
 - Authentication credentials must be provided
 - c-Eclipse uses vendor's API to retrieve required info

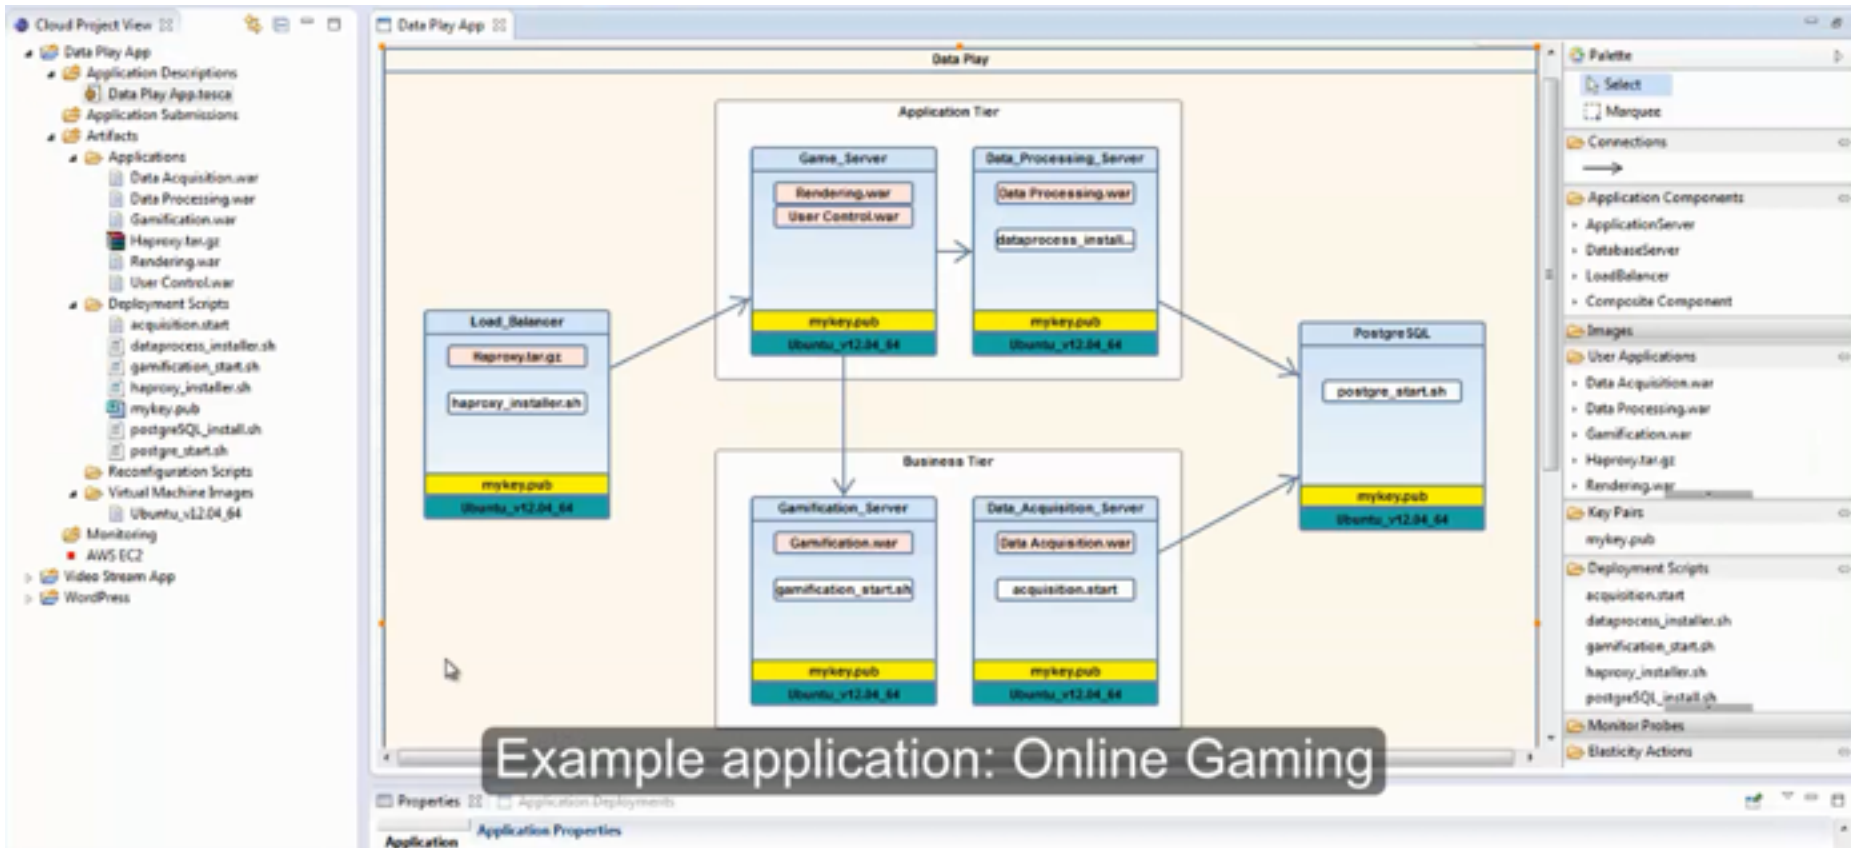

Elasticity Policies Specification

- c-Eclipse facilitates the specification of applications' **elasticity policies**
- Applications can scale at runtime based on user defined policies

Images

Flavors

The screenshot displays a cloud management interface for an application named "SCAN_Application". The architecture consists of several components:

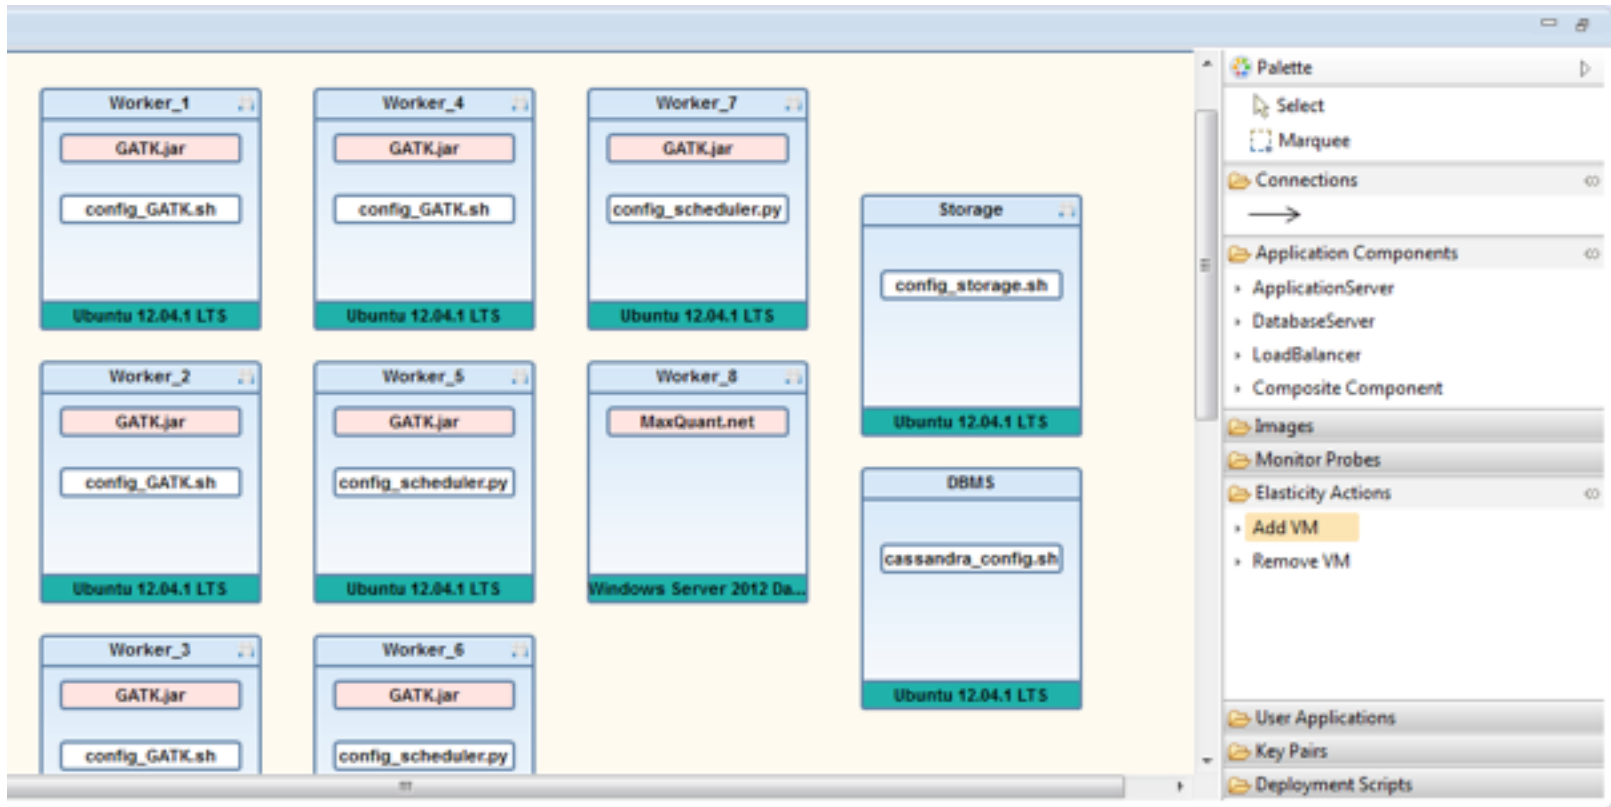

- Scheduler:** A single instance running on Ubuntu 12.04.1 LTS, containing the file `config_scheduler.py`.
- Workers:** Eight worker nodes, labeled Worker_1 through Worker_8. Most are running on Ubuntu 12.04.1 LTS and contain `GATK.jar` and `config_GATK.sh`. Worker_7 contains `config_scheduler.py`. Worker_8 is running on Windows Server 2012 Datacenter and contains `MaxQuant.net`.
- Storage:** A single instance running on Ubuntu 12.04.1 LTS, containing `config_storage.sh`.
- DBMS:** A single instance running on Ubuntu 12.04.1 LTS, containing `cassandra_config.sh`.

A properties window is open for a VM instance, showing the following details:

Property	Value
Name	vcpus1 ram:1024 disk:20
VM Image	vcpus1 ram:1024 disk:40
VM Description	vcpus1 ram:2048 disk:20
VM Type	vcpus1 ram:2048 disk:40
	vcpus1 ram:4096 disk:20
	vcpus1 ram:4096 disk:40
	vcpus2 ram:1024 disk:20
	vcpus2 ram:1024 disk:40
	vcpus2 ram:2048 disk:20
	vcpus2 ram:2048 disk:40
	vcpus2 ram:4096 disk:20
	vcpus2 ram:4096 disk:40
	vcpus4 ram:1024 disk:20
	vcpus4 ram:1024 disk:40
	vcpus4 ram:2048 disk:20
	vcpus4 ram:2048 disk:40
	vcpus4 ram:4096 disk:20
	vcpus4 ram:4096 disk:40
	vcpus1 ram:1024 disk:5
	vcpus1 ram:1024 disk:10

The Properties window also includes a "Number of Instances" section with input fields for Initial (set to 1), Min, and Max.

Resizing Actions

Monitoring Probes and Metrics

The screenshot displays a cloud management interface with a fleet of worker nodes and monitoring probes. The nodes are arranged in a grid:

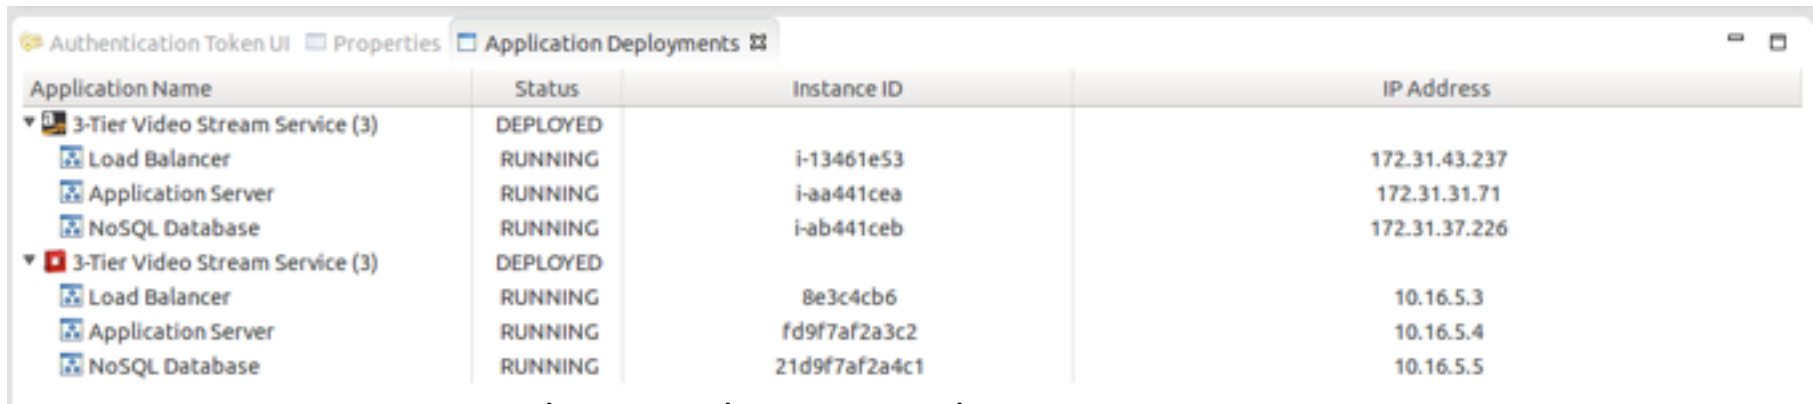

- Worker_1, Worker_2, Worker_3, Worker_4, Worker_5, Worker_6, Worker_7, Worker_8:** All are running Ubuntu 12.04.1 LTS. Worker_1, 2, 3, 4, and 6 contain GATK.jar and config_GATK.sh. Worker_5 contains GATK.jar and config_scheduler.py. Worker_7 contains GATK.jar and config_scheduler.py.
- Storage:** Running Ubuntu 12.04.1 LTS, containing config_storage.sh.
- DBMS:** Running Ubuntu 12.04.1 LTS, containing cassandra_config.sh.
- Worker_8:** Running Windows Server 2012 Datacenter, containing MaxQuant.net.

A **Palette** window on the right side of the interface shows a list of monitoring probes. The **Memory** category is expanded, and **memFree** is selected. Other visible categories include:

- Connections
- Application Components
- Images
- Monitor Probes
 - HAProxy
 - Memory (selected)
- Network
- CPU
- Elasticity Actions
- User Applications
- Key Pairs
- Deployment Scripts

Deployment over different Cloud Infrastructures

- Applications' deployment request are sent
- Applications are up and running on 2 infrastructures
- The status of the two deployments is shown in the Application Deployments View of c-Eclipse

The screenshot shows the 'Application Deployments' view in c-Eclipse. It displays two deployments of a '3-Tier Video Stream Service'. Each deployment consists of three components: a Load Balancer, an Application Server, and a NoSQL Database. The first deployment is on a cloud infrastructure (indicated by a blue icon) and all components are in a 'RUNNING' state. The second deployment is on a different infrastructure (indicated by a red icon) and all components are also in a 'RUNNING' state.

Application Name	Status	Instance ID	IP Address
3-Tier Video Stream Service (3)	DEPLOYED		
Load Balancer	RUNNING	i-13461e53	172.31.43.237
Application Server	RUNNING	i-aa441cea	172.31.31.71
NoSQL Database	RUNNING	i-ab441ceb	172.31.37.226
3-Tier Video Stream Service (3)	DEPLOYED		
Load Balancer	RUNNING	8e3c4cb6	10.16.5.3
Application Server	RUNNING	fd9f7af2a3c2	10.16.5.4
NoSQL Database	RUNNING	21d9f7af2a4c1	10.16.5.5

CAMF Extended Architecture

Summary and Conclusions

- **Elasticity works!** Videos with demos are available online (Youtube channel: CELAR Cloud)
- **Elastic Monitoring** can be performed in a **platform-independent** and **scalable** way, **non-intrusively**.
- **CAMF** represents a powerful vendor-neutral environment for the Cloud application lifecycle.
- In progress: **Information System** and **Cloud Analytics**.
- Open-source and available on **github**
